As with moments of mass, you can generalize this concept to obtain the moments of inertia about the x- and y-axes of a lamina of variable density. These second moments are denoted by I_x and I_y, and in each case the moment is the product of a mass times the square of a distance.

$$I_x = \int_R\int (y^2)\underbrace{\rho(x, y)\, dA}_{\text{Mass}} \qquad I_y = \int_R\int (x^2)\underbrace{\rho(x, y)\, dA}_{\text{Mass}}$$

Square of distance to x-axis (for I_x); Square of distance to y-axis (for I_y)

The sum of the moments I_x and I_y is called the **polar moment of inertia** and is denoted by I_0. For a lamina in the xy-plane, I_0 represents the moment of inertia of the lamina about the z-axis. The term "polar moment of inertia" stems from the fact that the square of the polar distance r is used in the calculation.

$$I_0 = \int_R\int (x^2 + y^2)\rho(x, y)\, dA = \int_R\int (r^2)\rho(x, y)\, dA$$

EXAMPLE 4 Finding the Moment of Inertia

Find the moment of inertia about the x-axis of the lamina in Example 3.

Solution From the definition of moment of inertia, you have

$$\begin{aligned} I_x &= \int_{-2}^{2}\int_{0}^{4-x^2} (y^2)(ky)\, dy\, dx \\ &= \frac{k}{4}\int_{-2}^{2} y^4\Big]_{0}^{4-x^2} dx && \text{Integrate with respect to } y. \\ &= \frac{k}{4}\int_{-2}^{2} (256 - 256x^2 + 96x^4 - 16x^6 + x^8)\, dx \\ &= \frac{k}{4}\left[256x - \frac{256x^3}{3} + \frac{96x^5}{5} - \frac{16x^7}{7} + \frac{x^9}{9}\right]_{-2}^{2} && \text{Integrate with respect to } x. \\ &= \frac{32{,}768k}{315}. && \text{Moment of inertia about } x\text{-axis} \end{aligned}$$

Planar lamina revolving at ω radians per second

Figure 14.40

The moment of inertia I of a revolving lamina can be used to measure its kinetic energy. For example, suppose a planar lamina is revolving about a line with an **angular speed** of ω radians per second, as shown in Figure 14.40. The kinetic energy E of the revolving lamina is

$$E = \frac{1}{2} I\omega^2. \qquad \text{Kinetic energy for rotational motion}$$

On the other hand, the kinetic energy E of a mass m moving in a straight line at a velocity v is

$$E = \frac{1}{2} mv^2. \qquad \text{Kinetic energy for linear motion}$$

So, the kinetic energy of a mass moving in a straight line is proportional to its mass, but the kinetic energy of a mass revolving about an axis is proportional to its moment of inertia.

The **radius of gyration** $\bar{\bar{r}}$ of a revolving mass m with moment of inertia I is defined as

$$\bar{\bar{r}} = \sqrt{\frac{I}{m}}. \qquad \text{Radius of gyration}$$

If the entire mass were located at a distance $\bar{\bar{r}}$ from its axis of revolution, it would have the same moment of inertia and, consequently, the same kinetic energy. For instance, the radius of gyration of the lamina in Example 4 about the x-axis is

$$\bar{\bar{y}} = \sqrt{\frac{I_x}{m}} = \sqrt{\frac{32{,}768k/315}{256k/15}} = \sqrt{\frac{128}{21}} \approx 2.469.$$

EXAMPLE 5 Finding the Radius of Gyration

Find the radius of gyration about the y-axis for the lamina corresponding to the region R: $0 \le y \le \sin x$, $0 \le x \le \pi$, where the density at (x, y) is given by $\rho(x, y) = x$.

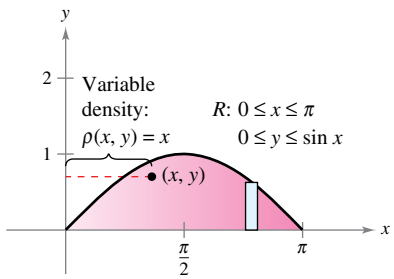

Figure 14.41

Solution The region R is shown in Figure 14.41. By integrating $\rho(x, y) = x$ over the region R, you can determine that the mass of the region is π. The moment of inertia about the y-axis is

$$\begin{aligned} I_y &= \int_0^{\pi} \int_0^{\sin x} x^3 \, dy \, dx \\ &= \int_0^{\pi} x^3 y \Big]_0^{\sin x} dx \qquad \text{Integrate with respect to } y. \\ &= \int_0^{\pi} x^3 \sin x \, dx \\ &= \Big[(3x^2 - 6)(\sin x) - (x^3 - 6x)(\cos x) \Big]_0^{\pi} \qquad \text{Integrate with respect to } x. \\ &= \pi^3 - 6\pi. \qquad \text{Moment of inertia about } y\text{-axis} \end{aligned}$$

So, the radius of gyration about the y-axis is

$$\begin{aligned} \bar{\bar{x}} &= \sqrt{\frac{I_y}{m}} \\ &= \sqrt{\frac{\pi^3 - 6\pi}{\pi}} \\ &= \sqrt{\pi^2 - 6} \\ &\approx 1.967. \qquad \text{Radius of gyration about } y\text{-axis} \end{aligned}$$

14.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain when you should use a double integral to find the mass of a planar lamina.
2. Describe what the moment of inertia measures. Explain how it is used to find the polar moment of inertia.

Finding the Mass of a Lamina **In Exercises 3–6, find the mass of the lamina described by the inequalities, given that its density is $\rho(x, y) = xy$.**

3. $0 \le x \le 2,\ 0 \le y \le 2$
4. $0 \le x \le 2,\ 0 \le y \le 4 - x^2$
5. $0 \le x \le 1,\ 0 \le y \le \sqrt{1 - x^2}$
6. $x \ge 0,\ 3 \le y \le 3 + \sqrt{9 - x^2}$

Finding the Center of Mass **In Exercises 7–10, find the mass and center of mass of the lamina corresponding to the region R for each density.**

7. R: square with vertices $(0, 0), (a, 0), (0, a), (a, a)$
   (a) $\rho = k$ (b) $\rho = ky$ (c) $\rho = kx$
8. R: rectangle with vertices $(0, 0), (a, 0), (0, b), (a, b)$
   (a) $\rho = kxy$ (b) $\rho = k(x^2 + y^2)$
9. R: triangle with vertices $(0, 0), (0, a), (a, a)$
   (a) $\rho = k$ (b) $\rho = ky$ (c) $\rho = kx$
10. R: triangle with vertices $(0, 0), (a/2, a), (a, 0)$
    (a) $\rho = k$ (b) $\rho = kxy$

11. **Translations in the Plane** Translate the lamina in Exercise 7 to the right five units and determine the resulting center of mass.
12. **Conjecture** Use the result of Exercise 11 to make a conjecture about the change in the center of mass when a lamina of constant density is translated c units horizontally or d units vertically. Is the conjecture true when the density is not constant? Explain.

Finding the Center of Mass **In Exercises 13–24, find the mass and center of mass of the lamina bounded by the graphs of the equations for the given density.**

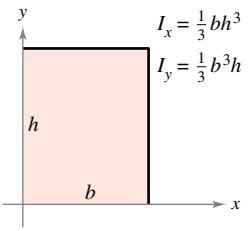
13. $y = \sqrt{x},\ y = 0,\ x = 1,\ \rho = ky$
14. $y = x^2,\ y = 0,\ x = 2,\ \rho = kxy$
15. $y = 4/x,\ y = 0,\ x = 1,\ x = 4,\ \rho = kx^2$
16. $y = \dfrac{1}{1 + x^2},\ y = 0,\ x = -1,\ x = 1,\ \rho = k$
17. $y = e^x,\ y = 0,\ x = 0,\ x = 1,\ \rho = k$
18. $y = e^{-x},\ y = 0,\ x = 0,\ x = 1,\ \rho = ky^2$
19. $y = 4 - x^2,\ y = 0,\ \rho = ky$
20. $x = 9 - y^2,\ x = 0,\ \rho = kx$
21. $y = \sin\dfrac{\pi x}{3},\ y = 0,\ x = 0,\ x = 3,\ \rho = k$
22. $y = \cos\dfrac{\pi x}{8},\ y = 0,\ x = 0,\ x = 4,\ \rho = ky$
23. $y = \sqrt{36 - x^2},\ 0 \le y \le x,\ \rho = k$
24. $x^2 + y^2 = 16,\ x \ge 0,\ y \ge 0,\ \rho = k(x^2 + y^2)$

Finding the Center of Mass Using Technology **In Exercises 25–28, use a graphing utility to find the mass and center of mass of the lamina bounded by the graphs of the equations for the given density.**

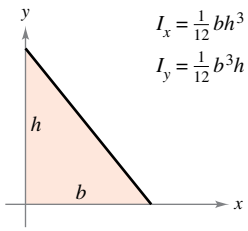
25. $y = e^{-x},\ y = 0,\ x = 0,\ x = 2,\ \rho = kxy$
26. $y = \ln x,\ y = 0,\ x = 1,\ x = e,\ \rho = k/x$
27. $r = 2\cos 3\theta,\ -\dfrac{\pi}{6} \le \theta \le \dfrac{\pi}{6},\ \rho = k$
28. $r = 1 + \cos\theta,\ \rho = k$

Finding the Radius of Gyration About Each Axis **In Exercises 29–34, verify the given moment(s) of inertia and find $\bar{\bar{x}}$ and $\bar{\bar{y}}$. Assume that each lamina has a density of $\rho = 1$ gram per square centimeter. (These regions are common shapes used in engineering.)**

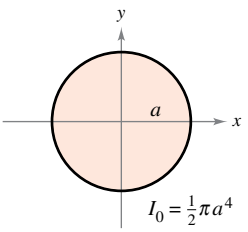
29. Rectangle



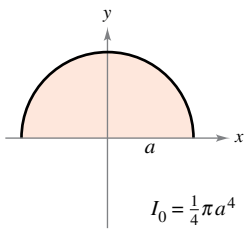
30. Right triangle



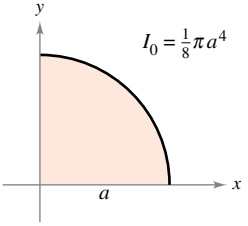
31. Circle



32. Semicircle



33. Quarter circle



34. Ellipse

Finding Moments of Inertia and Radii of Gyration **In Exercises 35–38, find I_x, I_y, I_0, $\bar{x}$, and $\bar{y}$ for the lamina bounded by the graphs of the equations.**

35. $y = 4 - x^2,\ y = 0,\ x > 0,\ \rho = kx$

36. $y = x,\ y = x^2,\ \rho = kxy$

37. $y = \sqrt{x},\ y = 0,\ x = 4,\ \rho = kxy$

38. $y = x^2,\ y^2 = x,\ \rho = kx$

Finding a Moment of Inertia Using Technology **In Exercises 39–42, set up the double integral required to find the moment of inertia about the given line of the lamina bounded by the graphs of the equations for the given density. Use a graphing utility to evaluate the double integral.**

39. $x^2 + y^2 = b^2,\ \rho = k,$ line: $x = a\ (a > b)$

40. $y = \sqrt{x},\ y = 0,\ x = 4,\ \rho = kx,$ line: $x = 6$

41. $y = \sqrt{a^2 - x^2},\ y = 0,\ \rho = ky,$ line: $y = a$

42. $y = 4 - x^2,\ y = 0,\ \rho = k,$ line: $y = 2$

Hydraulics **In Exercises 43–46, determine the location of the horizontal axis y_a at which a vertical gate in a dam is to be hinged so that there is no moment causing rotation under the indicated loading (see figure). The model for y_a is**

$$y_a = \bar{y} - \frac{I_{\bar{y}}}{hA}$$

where $\bar{y}$ is the y-coordinate of the centroid of the gate, $I_{\bar{y}}$ is the moment of inertia of the gate about the line $y = \bar{y}$, h is the depth of the centroid below the surface, and A is the area of the gate.

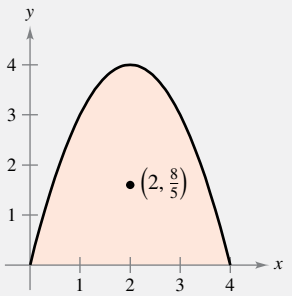
Exploring Concepts

47. What does it mean for an object to have a greater polar moment of inertia than another object?

48. **HOW DO YOU SEE IT?** The center of mass of the lamina of constant density shown in the figure is $\left(2, \frac{8}{5}\right)$. Make a conjecture about how the center of mass $(\bar{x}, \bar{y})$ changes for each given nonconstant density $\rho(x, y)$. Explain. (Make your conjecture *without* performing any calculations.)



(a) $\rho(x, y) = ky$ (b) $\rho(x, y) = k|2 - x|$

(c) $\rho(x, y) = kxy$ (d) $\rho(x, y) = k(4 - x)(4 - y)$

49. **Proof** Prove the following Theorem of Pappus: Let R be a region in a plane and let L be a line in the same plane such that L does not intersect the interior of R. If r is the distance between the centroid of R and the line, then the volume V of the solid of revolution formed by revolving R about the line is $V = 2\pi rA$, where A is the area of R.

SECTION PROJECT

Center of Pressure on a Sail

The center of pressure on a sail is the point (x_p, y_p) at which the total aerodynamic force may be assumed to act. If the sail is represented by a plane region R, then the center of pressure is

$$x_p = \frac{\int_R\int xy\,dA}{\int_R\int y\,dA} \quad \text{and} \quad y_p = \frac{\int_R\int y^2\,dA}{\int_R\int y\,dA}.$$

Consider a triangular sail with vertices at (0, 0), (2, 1), and (0, 5). Verify the value of each integral.

(a) $\displaystyle\int_R\int y\,dA = 10$

(b) $\displaystyle\int_R\int xy\,dA = \frac{35}{6}$

(c) $\displaystyle\int_R\int y^2\,dA = \frac{155}{6}$

Calculate the coordinates (x_p, y_p) of the center of pressure. Sketch a graph of the sail and indicate the location of the center of pressure.

14.5 Surface Area

GO DIGITAL

Use a double integral to find the area of a surface.

Surface Area

At this point, you know a great deal about the solid region lying between a surface and a closed and bounded region R in the xy-plane, as shown in Figure 14.42. For example, you know how to find the extrema of f on R (Section 13.8), the area of the base R of the solid (Section 14.1), the volume of the solid (Section 14.2), and the centroid of the base R (Section 14.4).

In this section, you will learn how to find the upper **surface area** of the solid. Later, you will learn how to find the centroid of the solid (Section 14.6) and the lateral surface area (Section 15.2).

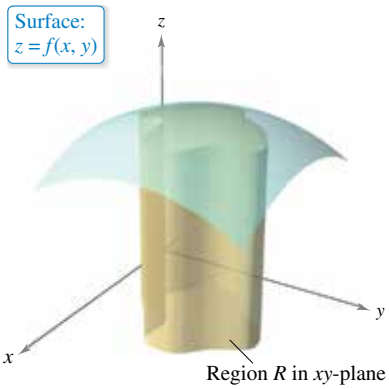

Figure 14.42

To begin, consider a surface S given by

$$z = f(x, y)$$ Surface defined over a region R

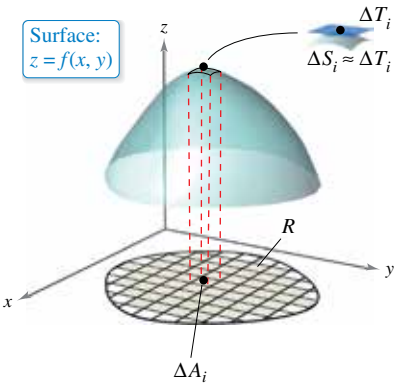

Figure 14.43

defined over a region R. Assume that R is closed and bounded and that f has continuous first partial derivatives. To find the surface area, construct an inner partition of R consisting of n rectangles, where the area of the ith rectangle R_i is $\Delta A_i = \Delta x_i \Delta y_i$, as shown in Figure 14.43. In each R_i, let (x_i, y_i) be the point that is closest to the origin. At the point $(x_i, y_i, z_i) = (x_i, y_i, f(x_i, y_i))$ on the surface S, construct a tangent plane T_i. The area of the portion of the tangent plane that lies directly above R_i is approximately equal to the area of the surface lying directly above R_i. That is, $\Delta T_i \approx \Delta S_i$. So, the surface area of S is approximated by

$$\sum_{i=1}^{n} \Delta S_i \approx \sum_{i=1}^{n} \Delta T_i.$$

To find the area of the parallelogram ΔT_i, note that its sides are given by the vectors

$$\mathbf{u} = \Delta x_i \mathbf{i} + f_x(x_i, y_i)\, \Delta x_i \mathbf{k}$$

and

$$\mathbf{v} = \Delta y_i \mathbf{j} + f_y(x_i, y_i)\, \Delta y_i \mathbf{k}.$$

From Theorem 11.8, the area of ΔT_i is given by $\|\mathbf{u} \times \mathbf{v}\|$, where

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \Delta x_i & 0 & f_x(x_i, y_i)\, \Delta x_i \\ 0 & \Delta y_i & f_y(x_i, y_i)\, \Delta y_i \end{vmatrix} \\ &= -f_x(x_i, y_i)\, \Delta x_i \Delta y_i \mathbf{i} - f_y(x_i, y_i)\, \Delta x_i \Delta y_i \mathbf{j} + \Delta x_i \Delta y_i \mathbf{k} \\ &= [-f_x(x_i, y_i)\mathbf{i} - f_y(x_i, y_i)\mathbf{j} + \mathbf{k}]\, \Delta A_i. \end{aligned}$$

So, the area of ΔT_i is $\|\mathbf{u} \times \mathbf{v}\| = \sqrt{[f_x(x_i, y_i)]^2 + [f_y(x_i, y_i)]^2 + 1}\, \Delta A_i$, and

$$\begin{aligned} \text{Surface area of } S &\approx \sum_{i=1}^{n} \Delta S_i \\ &\approx \sum_{i=1}^{n} \sqrt{1 + [f_x(x_i, y_i)]^2 + [f_y(x_i, y_i)]^2}\, \Delta A_i. \end{aligned}$$

This suggests the definition of surface area on the next page.

GO DIGITAL

Definition of Surface Area

If f and its first partial derivatives are continuous on the closed region R in the xy-plane, then the **area of the surface S** given by $z = f(x, y)$ over R is defined as

$$\text{Surface area} = \iint_R dS = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA.$$

REMARK Note that the differential ds of arc length in the xy-plane is

$$\sqrt{1 + [f'(x)]^2}\, dx$$

and the differential dS of surface area in space is

$$\sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA.$$

As an aid to remembering the double integral for surface area, it is helpful to note its similarity to the integral for arc length.

Length on x-axis: $\displaystyle\int_a^b dx$

Arc length in xy-plane: $\displaystyle\int_a^b ds = \int_a^b \sqrt{1 + [f'(x)]^2}\, dx$

Area in xy-plane: $\displaystyle\iint_R dA$

Surface area in space: $\displaystyle\iint_R dS = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA$

Like integrals for arc length, integrals for surface area are often very difficult to evaluate. However, one type that is not as difficult to evaluate is demonstrated in the next example.

EXAMPLE 1 The Surface Area of a Plane Region

Find the surface area of the portion of the plane

$$z = 2 - x - y$$

that lies above the circle $x^2 + y^2 \le 1$ in the first quadrant, as shown in Figure 14.44.

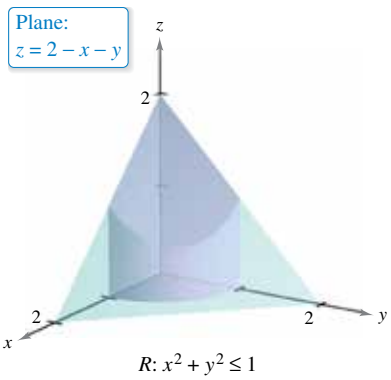

Figure 14.44

Solution Note that $f(x, y) = 2 - x - y$, $f_x(x, y) = -1$, and $f_y(x, y) = -1$ are continuous on the region R. So, the surface area is given by

$$S = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA \qquad \text{Formula for surface area}$$

$$= \iint_R \sqrt{1 + (-1)^2 + (-1)^2}\, dA \qquad \text{Substitute.}$$

$$= \iint_R \sqrt{3}\, dA$$

$$= \sqrt{3} \iint_R dA.$$

Note that the last integral is $\sqrt{3}$ times the area of the region R. Because R is a quarter circle of radius 1, the area of R is $\frac{1}{4}\pi(1^2)$ or $\pi/4$. So, the area of S is

$$S = \sqrt{3}\,(\text{area of } R)$$

$$= \sqrt{3}\left(\frac{\pi}{4}\right)$$

$$= \frac{\sqrt{3}\,\pi}{4}.$$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

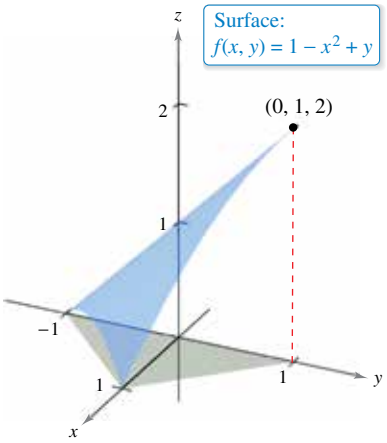

Figure 14.45

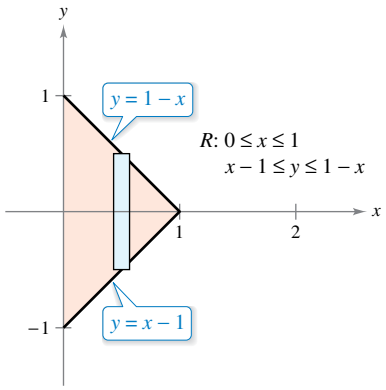

Figure 14.46

EXAMPLE 2 Finding Surface Area

See LarsonCalculus.com for an interactive version of this type of example.

Find the area of the portion of the surface $f(x, y) = 1 - x^2 + y$ that lies above the triangular region with vertices $(1, 0, 0)$, $(0, -1, 0)$, and $(0, 1, 0)$, as shown in Figure 14.45.

Solution Because $f_x(x, y) = -2x$ and $f_y(x, y) = 1$, you have

$$S = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA = \iint_R \sqrt{1 + 4x^2 + 1}\, dA.$$

In Figure 14.46, the bounds for R are $0 \le x \le 1$ and $x - 1 \le y \le 1 - x$. So, the integral becomes

$$\begin{aligned}
S &= \int_0^1 \int_{x-1}^{1-x} \sqrt{2 + 4x^2}\, dy\, dx && \text{Apply formula for surface area.} \\
&= \int_0^1 y\sqrt{2 + 4x^2} \Big]_{x-1}^{1-x} dx \\
&= \int_0^1 \left[(1 - x)\sqrt{2 + 4x^2} - (x - 1)\sqrt{2 + 4x^2}\right] dx \\
&= \int_0^1 \left(2\sqrt{2 + 4x^2} - 2x\sqrt{2 + 4x^2}\right) dx && \text{Integration tables (Appendix B), Formula 26 and Power Rule} \\
&= \left[x\sqrt{2 + 4x^2} + \ln\left(2x + \sqrt{2 + 4x^2}\right) - \frac{(2 + 4x^2)^{3/2}}{6}\right]_0^1 \\
&= \sqrt{6} + \ln\left(2 + \sqrt{6}\right) - \sqrt{6} - \ln\sqrt{2} + \frac{1}{3}\sqrt{2} \\
&\approx 1.618.
\end{aligned}$$

EXAMPLE 3 Change of Variables to Polar Coordinates

Find the surface area of the paraboloid $z = 1 + x^2 + y^2$ that lies above the unit circle, as shown in Figure 14.47.

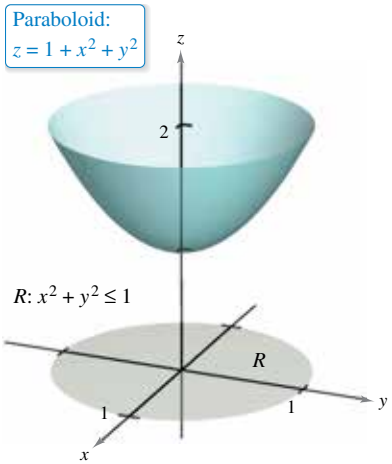

Figure 14.47

Solution Because $f_x(x, y) = 2x$ and $f_y(x, y) = 2y$, you have

$$S = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA = \iint_R \sqrt{1 + 4x^2 + 4y^2}\, dA.$$

You can convert to polar coordinates by letting $x = r\cos\theta$ and $y = r\sin\theta$. Then, because the region R is bounded by $0 \le r \le 1$ and $0 \le \theta \le 2\pi$, you have

$$\begin{aligned}
S &= \int_0^{2\pi} \int_0^1 \sqrt{1 + 4r^2}\, r\, dr\, d\theta && \text{Polar coordinates} \\
&= \int_0^{2\pi} \frac{1}{12}(1 + 4r^2)^{3/2} \Big]_0^1 d\theta && \text{Integrate with respect to } r. \\
&= \int_0^{2\pi} \frac{5\sqrt{5} - 1}{12}\, d\theta \\
&= \frac{5\sqrt{5} - 1}{12}\, \theta \Big]_0^{2\pi} && \text{Integrate with respect to } \theta. \\
&= \frac{\pi(5\sqrt{5} - 1)}{6} \\
&\approx 5.33.
\end{aligned}$$

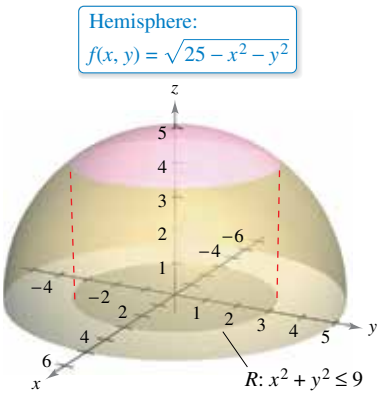

Figure 14.48

GO DIGITAL

EXAMPLE 4 Finding Surface Area

Find the surface area S of the portion of the hemisphere

$$f(x, y) = \sqrt{25 - x^2 - y^2}$$ Hemisphere

that lies above the region R bounded by the circle $x^2 + y^2 \le 9$, as shown in Figure 14.48.

Solution The first partial derivatives of f are

$$f_x(x, y) = \frac{-x}{\sqrt{25 - x^2 - y^2}}$$

and

$$f_y(x, y) = \frac{-y}{\sqrt{25 - x^2 - y^2}}$$

and, from the formula for surface area, you have

$$\begin{aligned} dS &= \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA \\ &= \sqrt{1 + \left(\frac{-x}{\sqrt{25 - x^2 - y^2}}\right)^2 + \left(\frac{-y}{\sqrt{25 - x^2 - y^2}}\right)^2}\, dA \\ &= \frac{5}{\sqrt{25 - x^2 - y^2}}\, dA. \end{aligned}$$

So, the surface area is

$$S = \iint_R \frac{5}{\sqrt{25 - x^2 - y^2}}\, dA.$$

You can convert to polar coordinates by letting $x = r\cos\theta$ and $y = r\sin\theta$. Then, because the region R is bounded by $0 \le r \le 3$ and $0 \le \theta \le 2\pi$, you obtain

$$\begin{aligned} S &= \int_0^{2\pi}\int_0^3 \frac{5}{\sqrt{25 - r^2}}\, r\, dr\, d\theta && \text{Polar coordinates} \\ &= 5\int_0^{2\pi} -\sqrt{25 - r^2}\,\Big]_0^3\, d\theta && \text{Integrate with respect to } r. \\ &= 5\int_0^{2\pi} d\theta \\ &= 10\pi. && \text{Integrate with respect to } \theta. \end{aligned}$$

The procedure used in Example 4 can be extended to find the surface area of a sphere by using the region R bounded by the circle $x^2 + y^2 \le a^2$, where $0 < a < 5$, as shown in Figure 14.49. The surface area of the portion of the hemisphere

$$f(x, y) = \sqrt{25 - x^2 - y^2}$$

lying above the circular region can be shown to be

$$\begin{aligned} S &= \iint_R \frac{5}{\sqrt{25 - x^2 - y^2}}\, dA \\ &= \int_0^{2\pi}\int_0^a \frac{5}{\sqrt{25 - r^2}}\, r\, dr\, d\theta \\ &= 10\pi\left(5 - \sqrt{25 - a^2}\right). \end{aligned}$$

By taking the limit as a approaches 5 and doubling the result, you obtain a total area of 100π. (The surface area of a sphere of radius r is $S = 4\pi r^2$.)

You can use Simpson's Rule or the Trapezoidal Rule to approximate the value of a double integral, *provided* you can get through the first integration. This is demonstrated in the next example.

EXAMPLE 5 Approximating Surface Area by Simpson's Rule

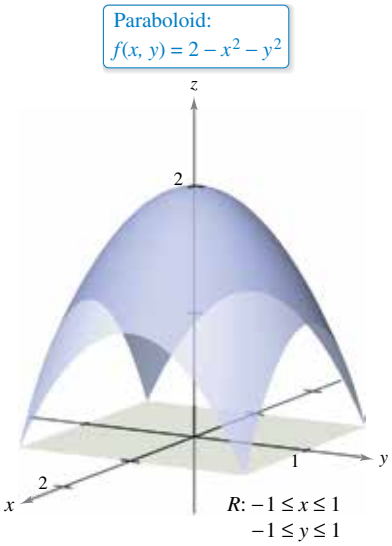

Figure 14.50

Find the area of the surface of the paraboloid

$$f(x, y) = 2 - x^2 - y^2$$ Paraboloid

that lies above the square region bounded by

$$-1 \le x \le 1 \quad \text{and} \quad -1 \le y \le 1$$

as shown in Figure 14.50.

Solution Using the partial derivatives

$$f_x(x, y) = -2x \quad \text{and} \quad f_y(x, y) = -2y$$

you have a surface area of

$$S = \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2}\, dA$$ Formula for surface area

$$= \iint_R \sqrt{1 + (-2x)^2 + (-2y)^2}\, dA$$ Substitute.

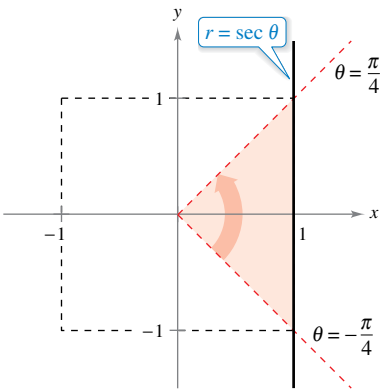
$$= \iint_R \sqrt{1 + 4x^2 + 4y^2}\, dA.$$ Simplify.

In polar coordinates, the line $x = 1$ is given by

$$r \cos\theta = 1 \quad \text{or} \quad r = \sec\theta$$

and you can determine from Figure 14.51 that one-fourth of the region R is bounded by

$$0 \le r \le \sec\theta \quad \text{and} \quad -\frac{\pi}{4} \le \theta \le \frac{\pi}{4}.$$



One-fourth of the region R is bounded by $0 \le r \le \sec\theta$ and $-\frac{\pi}{4} \le \theta \le \frac{\pi}{4}$.

Figure 14.51

Letting $x = r\cos\theta$ and $y = r\sin\theta$ produces

$$\frac{1}{4}S = \frac{1}{4}\iint_R \sqrt{1 + 4x^2 + 4y^2}\, dA$$ One-fourth of surface area

$$= \int_{-\pi/4}^{\pi/4}\int_0^{\sec\theta} \sqrt{1 + 4r^2}\, r\, dr\, d\theta$$ Polar coordinates

$$= \int_{-\pi/4}^{\pi/4} \frac{1}{12}(1 + 4r^2)^{3/2}\Big]_0^{\sec\theta} d\theta$$ Integrate with respect to r.

$$= \frac{1}{12}\int_{-\pi/4}^{\pi/4} [(1 + 4\sec^2\theta)^{3/2} - 1]\, d\theta.$$

After multiplying each side by 4, you can approximate the integral using Simpson's Rule with $n = 10$ to find that the area of the surface is

$$S = 4\left(\frac{1}{12}\right)\int_{-\pi/4}^{\pi/4} [(1 + 4\sec^2\theta)^{3/2} - 1]\, d\theta \approx 7.450.$$

TECHNOLOGY Most graphing utilities that are capable of performing symbolic integration for multiple integrals are also capable of performing numerical approximation techniques. If you have access to a graphing utility with this feature, use it to approximate the value of the integral in Example 5.

14.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. What is the differential of surface area, dS, in space?
2. Write a double integral that represents the surface area of the portion of the plane $z = 3$ that lies above the rectangular region with vertices $(0, 0)$, $(4, 0)$, $(0, 5)$, and $(4, 5)$. Then find the surface area without integrating.

Finding Surface Area **In Exercises 3–16, find the area of the surface given by $z = f(x, y)$ that lies above the region R.**

3. $f(x, y) = 2x + 2y$
   R: triangle with vertices $(0, 0)$, $(4, 0)$, $(0, 4)$
4. $f(x, y) = 15 + 2x - 3y$
   R: square with vertices $(0, 0)$, $(3, 0)$, $(0, 3)$, $(3, 3)$
5. $f(x, y) = 4 + 5x + 6y$, $R = \{(x, y): x^2 + y^2 \le 4\}$
6. $f(x, y) = 12 + 2x - 3y$, $R = \{(x, y): x^2 + y^2 \le 9\}$
7. $f(x, y) = 9 - x^2$
   R: square with vertices $(0, 0)$, $(2, 0)$, $(0, 2)$, $(2, 2)$
8. $f(x, y) = y^2$
   R: square with vertices $(0, 0)$, $(3, 0)$, $(0, 3)$, $(3, 3)$
9. $f(x, y) = 3 + 2x^{3/2}$
   R: rectangle with vertices $(0, 0)$, $(0, 4)$, $(1, 4)$, $(1, 0)$
10. $f(x, y) = 2 + \frac{2}{3}y^{3/2}$
    $R = \{(x, y): 0 \le x \le 2, 0 \le y \le 2 - x\}$
11. $f(x, y) = \ln|\sec x|$
    $R = \left\{(x, y): 0 \le x \le \frac{\pi}{4}, 0 \le y \le \tan x\right\}$
12. $f(x, y) = 13 + x^2 - y^2$
    $R = \{(x, y): x^2 + y^2 \le 4\}$
13. $f(x, y) = \sqrt{x^2 + y^2}$
    $R = \{(x, y): 0 \le f(x, y) \le 1\}$
14. $f(x, y) = xy$
    $R = \{(x, y): x^2 + y^2 \le 16\}$
15. $f(x, y) = \sqrt{a^2 - x^2 - y^2}$
    $R = \{(x, y): x^2 + y^2 \le b^2, \quad 0 < b < a\}$
16. $f(x, y) = \sqrt{a^2 - x^2 - y^2}$
    $R = \{(x, y): x^2 + y^2 \le a^2\}$

Finding Surface Area **In Exercises 17–20, find the area of the surface.**

17. The portion of the plane $z = 12 - 3x - 2y$ in the first octant
18. The portion of the paraboloid $z = 16 - x^2 - y^2$ in the first octant
19. The portion of the sphere $x^2 + y^2 + z^2 = 25$ inside the cylinder $x^2 + y^2 = 9$
20. The portion of the cone $z = 2\sqrt{x^2 + y^2}$ inside the cylinder $x^2 + y^2 = 4$

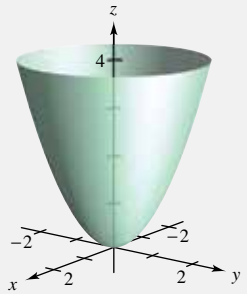
Finding Surface Area Using Technology **In Exercises 21–26, write a double integral that represents the surface area of $z = f(x, y)$ that lies above the region R. Use a graphing utility to evaluate the double integral.**

21. $f(x, y) = 2y + x^2$
    R: triangle with vertices $(0, 0)$, $(1, 0)$, $(1, 1)$
22. $f(x, y) = 2x + y^2$
    R: triangle with vertices $(0, 0)$, $(2, 0)$, $(2, 2)$
23. $f(x, y) = 9 - x^2 - y^2$
    $R = \{(x, y): 0 \le f(x, y)\}$
24. $f(x, y) = x^2 + y^2$
    $R = \{(x, y): 0 \le f(x, y) \le 16\}$
25. $f(x, y) = 4 - x^2 - y^2$
    $R = \{(x, y): 0 \le x \le 1, 0 \le y \le 1\}$
26. $f(x, y) = \frac{2}{3}x^{3/2} + \cos x$
    $R = \{(x, y): 0 \le x \le 1, 0 \le y \le 1\}$

Setting Up a Double Integral **In Exercises 27–29, set up a double integral that represents the area of the surface given by $z = f(x, y)$ that lies above the region R.**

27. $f(x, y) = e^{xy}$
    $R = \{(x, y): 0 \le x \le 4, 0 \le y \le 10\}$
28. $f(x, y) = x^2 - 3xy - y^2$
    $R = \{(x, y): 0 \le x \le 4, 0 \le y \le x\}$
29. $f(x, y) = \cos(x^2 + y^2)$
    $R = \left\{(x, y): x^2 + y^2 \le \frac{\pi}{2}\right\}$

30. **HOW DO YOU SEE IT?** Consider the surface $f(x, y) = x^2 + y^2$ (see figure) and the surface area of f that lies above each region R. Without integrating, order the surface areas from least to greatest. Explain.



(a) R: rectangle with vertices $(0, 0)$, $(2, 0)$, $(2, 2)$, $(0, 2)$
(b) R: triangle with vertices $(0, 0)$, $(2, 0)$, $(0, 2)$
(c) $R = \{(x, y): x^2 + y^2 \le 4$, first quadrant only$\}$

Exploring Concepts

31. Will the surface area of the graph of a function $z = f(x, y)$ that lies above a region R increase when the graph is shifted k units vertically? Explain using the partial derivatives of z.

32. Surface Area Consider the surface $f(x, y) = x + y$. What is the relationship between the area of the surface that lies above the region

$R_1 = \{(x, y): x^2 + y^2 \leq 1\}$

and the area of the surface that lies above the region

$R_2 = \{(x, y): x^2 + y^2 \leq 4\}$?

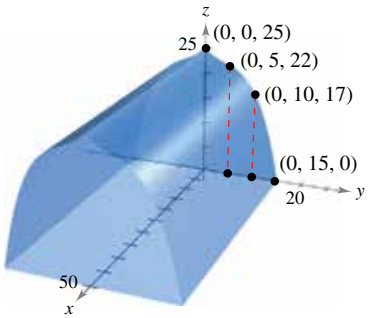
33. Product Design A company produces a spherical object of radius 25 centimeters. A hole of radius 4 centimeters is drilled through the center of the object.

(a) Find the volume of the object.

(b) Find the outer surface area of the object.

34. Modeling Data

A company builds a warehouse with dimensions 30 feet by 50 feet. The symmetrical shape and selected heights of the roof are shown in the figure.



(a) Use the regression capabilities of a graphing utility to find a model of the form

$z = ay^3 + by^2 + cy + d$

for the roof line.

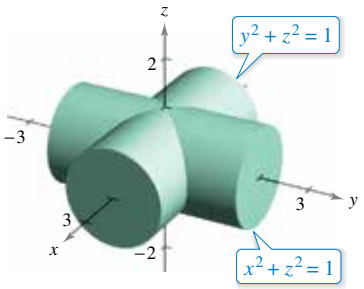
(b) Use the numerical integration capabilities of a graphing utility and the model in part (a) to approximate the volume of storage space in the warehouse.

(c) Use the numerical integration capabilities of a graphing utility and the model in part (a) to approximate the surface area of the roof.

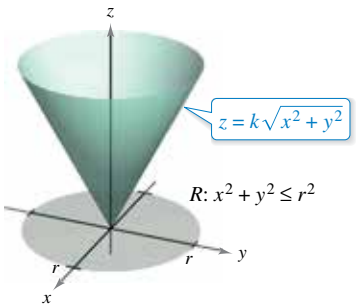
(d) Approximate the arc length of the roof line and find the surface area of the roof by multiplying the arc length by the length of the warehouse. Compare the results and the integrations with those found in part (c).

AlexKZ/Shutterstock.com

35. Surface Area Find the surface area of the solid of intersection of the cylinders $x^2 + z^2 = 1$ and $y^2 + z^2 = 1$ (see figure).



36. Surface Area Show that the surface area of the cone $z = k\sqrt{x^2 + y^2}$, $k > 0$, that lies above the circular region $x^2 + y^2 \leq r^2$ in the xy-plane is $\pi r^2\sqrt{k^2 + 1}$ (see figure).



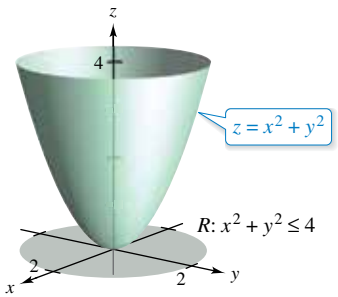
SECTION PROJECT

Surface Area in Polar Coordinates

(a) Use the formula for surface area in rectangular coordinates to derive the following formula for surface area in polar coordinates, where $z = f(x, y) = f(r\cos\theta, r\sin\theta)$. (*Hint:* You will need to use the Chain Rule for functions of two variables.)

$$S = \iint_R \sqrt{1 + f_r^2 + \frac{1}{r^2}f_\theta^2}\, r\, dr\, d\theta$$

(b) Use the formula from part (a) to find the surface area of the paraboloid $z = x^2 + y^2$ that lies above the circular region $x^2 + y^2 \leq 4$ in the xy-plane (see figure).



(c) Use the formula from part (a) to find the surface area of $z = xy$ that lies above the circular region $x^2 + y^2 \leq 16$ in the xy-plane. Compare your answer with your answer to Exercise 14.

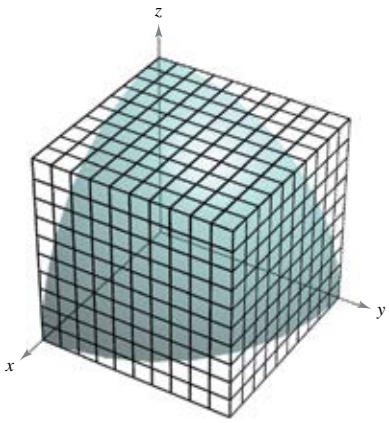
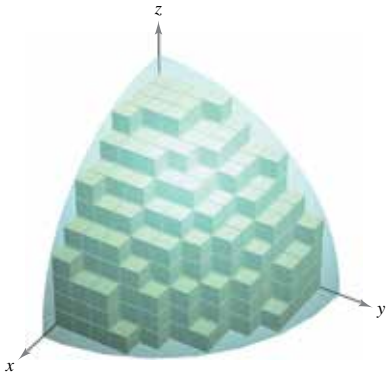
14.6 Triple Integrals and Applications

GO DIGITAL

- **Use a triple integral to find the volume of a solid region.**
- **Find the center of mass and moments of inertia of a solid region.**



Solid region Q



Volume of $Q \approx \sum_{i=1}^{n} \Delta V_i$

Figure 14.52

Triple Integrals

The procedure used to define a **triple integral** follows that used for double integrals. Consider a function f of three variables that is continuous over a bounded solid region Q. Then encompass Q with a network of boxes and form the **inner partition** consisting of all boxes lying entirely within Q, as shown in Figure 14.52. The volume of the ith box is

$$\Delta V_i = \Delta x_i \Delta y_i \Delta z_i. \qquad \text{Volume of } i\text{th box}$$

The **norm** $\|\Delta\|$ of the partition is the length of the longest diagonal of the n boxes in the partition. Choose a point (x_i, y_i, z_i) in each box and form the Riemann sum

$$\sum_{i=1}^{n} f(x_i, y_i, z_i)\, \Delta V_i.$$

Taking the limit as $\|\Delta\| \to 0$ leads to the following definition.

Definition of Triple Integral

If f is continuous over a bounded solid region Q, then the **triple integral of f over Q** is defined as

$$\iiint_Q f(x, y, z)\, dV = \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} f(x_i, y_i, z_i)\, \Delta V_i$$

provided the limit exists. The **volume** of the solid region Q is given by

$$\text{Volume of } Q = \iiint_Q dV.$$

Some of the properties of double integrals in Theorem 14.1 can be restated in terms of triple integrals.

1. $\displaystyle\iiint_Q cf(x, y, z)\, dV = c \iiint_Q f(x, y, z)\, dV$

2. $\displaystyle\iiint_Q [f(x, y, z) \pm g(x, y, z)]\, dV = \iiint_Q f(x, y, z)\, dV \pm \iiint_Q g(x, y, z)\, dV$

3. $\displaystyle\iiint_Q f(x, y, z)\, dV = \iiint_{Q_1} f(x, y, z)\, dV + \iiint_{Q_2} f(x, y, z)\, dV$

In the properties above, Q is the union of two nonoverlapping solid subregions Q_1 and Q_2. If the solid region Q is simple, then the triple integral $\iiint f(x, y, z)\, dV$ can be evaluated with an iterated integral using one of the six possible orders of integration listed below.

$dx\, dy\, dz$ $\quad dy\, dx\, dz$ $\quad dz\, dx\, dy$

$dx\, dz\, dy$ $\quad dy\, dz\, dx$ $\quad dz\, dy\, dx$

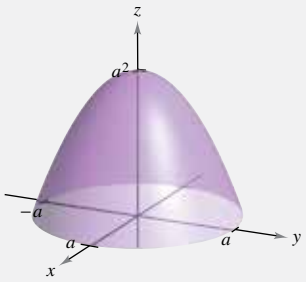
Exploration

Volume of a Paraboloid Sector In the Explorations on pages 983 and 992, you were asked to summarize the different ways you know of finding the volume of the solid bounded by the paraboloid

$z = a^2 - x^2 - y^2, \quad a > 0$

and the xy-plane. You now know one more way. Use it to find the volume of the solid.



The following version of Fubini's Theorem describes a region that is considered simple with respect to the order $dz\,dy\,dx$. Similar versions of this theorem can be given for the other five orders.

THEOREM 14.4 Evaluation by Iterated Integrals

Let f be continuous on a solid region Q defined by

$$a \le x \le b,$$
$$h_1(x) \le y \le h_2(x),$$
$$g_1(x, y) \le z \le g_2(x, y)$$

where h_1, h_2, g_1, and g_2 are continuous functions. Then,

$$\iiint_Q f(x, y, z)\,dV = \int_a^b \int_{h_1(x)}^{h_2(x)} \int_{g_1(x,y)}^{g_2(x,y)} f(x, y, z)\,dz\,dy\,dx.$$

To evaluate a triple iterated integral in the order $dz\,dy\,dx$, hold *both* x and y constant for the innermost integration. Then hold x constant for the second integration.

EXAMPLE 1 Evaluating a Triple Iterated Integral

Evaluate the triple iterated integral

$$\int_0^2 \int_0^x \int_0^{x+y} e^x(y + 2z)\,dz\,dy\,dx.$$

Solution For the first integration, hold x and y constant and integrate with respect to z.

$$\int_0^2 \int_0^x \int_0^{x+y} e^x(y + 2z)\,dz\,dy\,dx = \int_0^2 \int_0^x e^x(yz + z^2)\Big]_0^{x+y} dy\,dx$$
$$= \int_0^2 \int_0^x e^x(x^2 + 3xy + 2y^2)\,dy\,dx$$

For the second integration, hold x constant and integrate with respect to y.

$$\int_0^2 \int_0^x e^x(x^2 + 3xy + 2y^2)\,dy\,dx = \int_0^2 \left[e^x\left(x^2y + \frac{3xy^2}{2} + \frac{2y^3}{3}\right)\right]_0^x dx$$
$$= \frac{19}{6}\int_0^2 x^3e^x\,dx$$

Finally, integrate with respect to x.

$$\frac{19}{6}\int_0^2 x^3e^x\,dx = \frac{19}{6}\Big[e^x(x^3 - 3x^2 + 6x - 6)\Big]_0^2$$
$$= 19\left(\frac{e^2}{3} + 1\right)$$
$$\approx 65.797$$

REMARK To do the last integration in Example 1, use integration by parts three times.

Example 1 demonstrates the integration order $dz\,dy\,dx$. For other orders, you can follow a similar procedure. For instance, to evaluate a triple iterated integral in the order $dx\,dy\,dz$, hold both y and z constant for the innermost integration and integrate with respect to x. Then, for the second integration, hold z constant and integrate with respect to y. Finally, for the third integration, integrate with respect to z.

GO DIGITAL

Solid region Q lies between two surfaces.
Figure 14.53

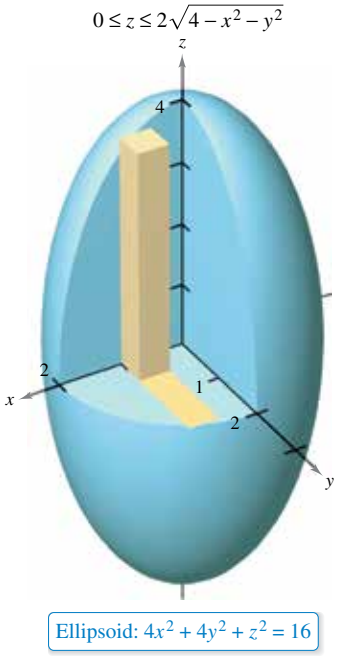

Figure 14.54

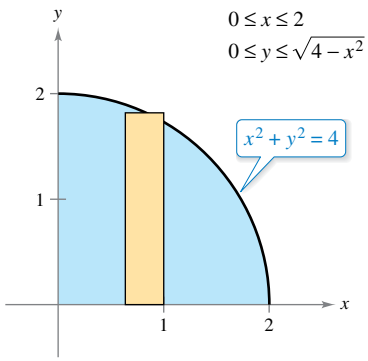

Figure 14.55

To find the limits for a particular order of integration, it is generally advisable first to determine the innermost limits, which may be functions of the outer two variables. Then, by projecting the solid Q onto the coordinate plane of the outer two variables, you can determine their limits of integration by the methods used for double integrals. For instance, to evaluate

$$\iiint_Q f(x, y, z)\, dz\, dy\, dx$$

first determine the limits for z; the integral then has the form

$$\int\int\left[\int_{g_1(x, y)}^{g_2(x, y)} f(x, y, z)\, dz\right] dy\, dx.$$

By projecting the solid Q onto the xy-plane, you can determine the limits for x and y as you did for double integrals, as shown in Figure 14.53.

EXAMPLE 2 Using a Triple Integral to Find Volume

Find the volume of the ellipsoid given by $4x^2 + 4y^2 + z^2 = 16$.

Solution Because x, y, and z play similar roles in the equation, the order of integration is probably immaterial, and you can arbitrarily choose $dz\, dy\, dx$. Moreover, you can simplify the calculation by considering only the portion of the ellipsoid lying in the first octant, as shown in Figure 14.54. From the order $dz\, dy\, dx$, you first determine the bounds for z.

$$0 \le z \le 2\sqrt{4 - x^2 - y^2} \qquad \text{Bounds for } z$$

In Figure 14.55, the bounds for x and y are

$$0 \le x \le 2 \quad \text{and} \quad 0 \le y \le \sqrt{4 - x^2}. \qquad \text{Bounds for } x \text{ and } y$$

So, the volume of the ellipsoid is

$$V = \iiint_Q dV \qquad \text{Formula for volume}$$

$$= 8\int_0^2\int_0^{\sqrt{4-x^2}}\int_0^{2\sqrt{4-x^2-y^2}} dz\, dy\, dx \qquad \text{Convert to iterated integral.}$$

$$= 8\int_0^2\int_0^{\sqrt{4-x^2}} z\Big]_0^{2\sqrt{4-x^2-y^2}} dy\, dx$$

$$= 16\int_0^2\int_0^{\sqrt{4-x^2}} \sqrt{(4 - x^2) - y^2}\, dy\, dx \qquad \text{Integration tables (Appendix B), Formula 37}$$

$$= 8\int_0^2\left[y\sqrt{4 - x^2 - y^2} + (4 - x^2)\arcsin\left(\frac{y}{\sqrt{4 - x^2}}\right)\right]_0^{\sqrt{4-x^2}} dx$$

$$= 8\int_0^2 [0 + (4 - x^2)\arcsin(1) - 0 - 0]\, dx$$

$$= 8\int_0^2 (4 - x^2)\left(\frac{\pi}{2}\right) dx$$

$$= 4\pi\left[4x - \frac{x^3}{3}\right]_0^2$$

$$= \frac{64\pi}{3}.$$

GO DIGITAL

Example 2 is unusual in that all six possible orders of integration produce integrals of comparable difficulty. Try setting up some other possible orders of integration to find the volume of the ellipsoid. For instance, the order $dx\,dy\,dz$ yields the integral

$$V = 8\int_0^4 \int_0^{\sqrt{16-z^2}/2} \int_0^{\sqrt{16-4y^2-z^2}/2} dx\,dy\,dz.$$

The evaluation of this integral yields the same volume obtained in Example 2. This is always the case—the order of integration does not affect the value of the integral. However, the order of integration often does affect the complexity of the integral. In Example 3, the given order of integration is not convenient, so you can change the order to simplify the problem.

EXAMPLE 3 Changing the Order of Integration

Evaluate $\displaystyle\int_0^{\sqrt{\pi/2}} \int_x^{\sqrt{\pi/2}} \int_1^3 \sin(y^2)\,dz\,dy\,dx.$

Solution Note that after one integration in the given order, you would encounter the integral $2\int \sin(y^2)\,dy$, which is not an elementary function. To avoid this problem, change the order of integration to $dz\,dx\,dy$ so that y is the outer variable. From Figure 14.56, the solid region Q is

$$0 \le x \le \sqrt{\frac{\pi}{2}}$$

$$x \le y \le \sqrt{\frac{\pi}{2}}$$

$$1 \le z \le 3$$

and the projection of Q in the xy-plane yields the bounds

$$0 \le y \le \sqrt{\frac{\pi}{2}}$$

and

$$0 \le x \le y.$$

So, evaluating the triple integral using the order $dz\,dx\,dy$ produces

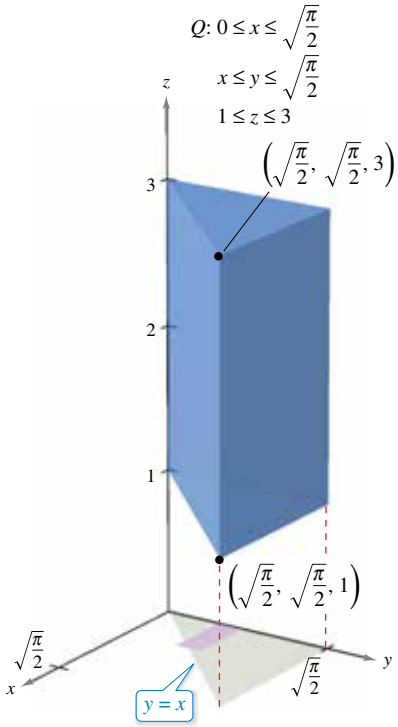

Figure 14.56

$$\begin{aligned}
\int_0^{\sqrt{\pi/2}} \int_0^y \int_1^3 \sin(y^2)\,dz\,dx\,dy &= \int_0^{\sqrt{\pi/2}} \int_0^y z\sin(y^2)\Big]_1^3\,dx\,dy \\
&= 2\int_0^{\sqrt{\pi/2}} \int_0^y \sin(y^2)\,dx\,dy \\
&= 2\int_0^{\sqrt{\pi/2}} x\sin(y^2)\Big]_0^y\,dy \\
&= 2\int_0^{\sqrt{\pi/2}} y\sin(y^2)\,dy \\
&= -\cos(y^2)\Big]_0^{\sqrt{\pi/2}} \\
&= 1.
\end{aligned}$$

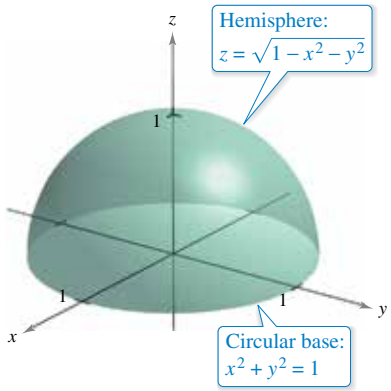
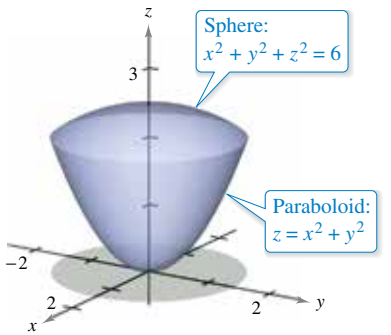
Q: $0 \le z \le 1 - y^2$
$1 - y \le x \le 3 - y$
$0 \le y \le 1$

Figure 14.57



Q: $0 \le z \le \sqrt{1 - x^2 - y^2}$
$-\sqrt{1 - y^2} \le x \le \sqrt{1 - y^2}$
$-1 \le y \le 1$

Figure 14.58



Q: $x^2 + y^2 \le z \le \sqrt{6 - x^2 - y^2}$
$-\sqrt{2 - x^2} \le y \le \sqrt{2 - x^2}$
$-\sqrt{2} \le x \le \sqrt{2}$

Figure 14.59

EXAMPLE 4 Determining the Limits of Integration

Set up a triple integral for the volume of each solid region.

a. The region in the first octant bounded above by the cylinder $z = 1 - y^2$ and lying between the vertical planes $x + y = 1$ and $x + y = 3$

b. The upper hemisphere $z = \sqrt{1 - x^2 - y^2}$

c. The region bounded below by the paraboloid $z = x^2 + y^2$ and above by the sphere $x^2 + y^2 + z^2 = 6$

Solution

a. In Figure 14.57, note that the solid is bounded below by the xy-plane ($z = 0$) and above by the cylinder $z = 1 - y^2$. So,

$$0 \le z \le 1 - y^2. \qquad \text{Bounds for } z$$

Projecting the region onto the xy-plane produces a parallelogram. Because two sides of the parallelogram are parallel to the x-axis, you have the following bounds:

$$1 - y \le x \le 3 - y \quad \text{and} \quad 0 \le y \le 1. \qquad \text{Bounds for } x \text{ and } y$$

So, the volume of the region is given by

$$V = \iiint_Q dV = \int_0^1 \int_{1-y}^{3-y} \int_0^{1-y^2} dz\, dx\, dy.$$

b. For the upper hemisphere $z = \sqrt{1 - x^2 - y^2}$, you have

$$0 \le z \le \sqrt{1 - x^2 - y^2}. \qquad \text{Bounds for } z$$

In Figure 14.58, note that the projection of the hemisphere onto the xy-plane is the circle

$$x^2 + y^2 = 1$$

and you can use either order $dx\, dy$ or $dy\, dx$. Choosing the first produces

$$-\sqrt{1 - y^2} \le x \le \sqrt{1 - y^2} \quad \text{and} \quad -1 \le y \le 1 \qquad \text{Bounds for } x \text{ and } y$$

which implies that the volume of the region is given by

$$V = \iiint_Q dV = \int_{-1}^{1} \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \int_0^{\sqrt{1-x^2-y^2}} dz\, dx\, dy.$$

c. For the region bounded below by the paraboloid $z = x^2 + y^2$ and above by the sphere $x^2 + y^2 + z^2 = 6$, you have

$$x^2 + y^2 \le z \le \sqrt{6 - x^2 - y^2}. \qquad \text{Bounds for } z$$

The sphere and the paraboloid intersect at $z = 2$. Moreover, in Figure 14.59 the projection of the solid region onto the xy-plane is the circle

$$x^2 + y^2 = 2.$$

Using the order $dy\, dx$ produces

$$-\sqrt{2 - x^2} \le y \le \sqrt{2 - x^2} \quad \text{and} \quad -\sqrt{2} \le x \le \sqrt{2} \qquad \text{Bounds for } x \text{ and } y$$

which implies that the volume of the region is given by

$$V = \iiint_Q dV = \int_{-\sqrt{2}}^{\sqrt{2}} \int_{-\sqrt{2-x^2}}^{\sqrt{2-x^2}} \int_{x^2+y^2}^{\sqrt{6-x^2-y^2}} dz\, dy\, dx.$$

Center of Mass and Moments of Inertia

In the remainder of this section, two important engineering applications of triple integrals are discussed. Consider a solid region Q whose density is given by the **density function ρ.** The **center of mass** of a solid region Q of mass m is given by $(\bar{x}, \bar{y}, \bar{z})$, where

$$m = \iiint_Q \rho(x, y, z)\, dV \qquad \text{Mass of the solid}$$

$$M_{yz} = \iiint_Q x\rho(x, y, z)\, dV \qquad \text{First moment about } yz\text{-plane}$$

$$M_{xz} = \iiint_Q y\rho(x, y, z)\, dV \qquad \text{First moment about } xz\text{-plane}$$

$$M_{xy} = \iiint_Q z\rho(x, y, z)\, dV \qquad \text{First moment about } xy\text{-plane}$$

and

$$\bar{x} = \frac{M_{yz}}{m}, \quad \bar{y} = \frac{M_{xz}}{m}, \quad \bar{z} = \frac{M_{xy}}{m}.$$

The quantities M_{yz}, M_{xz}, and M_{xy} are called the **first moments** of the region Q about the yz-, xz-, and xy-planes, respectively.

The first moments for solid regions are taken about a plane, whereas the second moments for solids are taken about a line. The **second moments** (or **moments of inertia**) about the x-, y-, and z-axes are

$$I_x = \iiint_Q (y^2 + z^2)\rho(x, y, z)\, dV \qquad \text{Moment of inertia about } x\text{-axis}$$

$$I_y = \iiint_Q (x^2 + z^2)\rho(x, y, z)\, dV \qquad \text{Moment of inertia about } y\text{-axis}$$

and

$$I_z = \iiint_Q (x^2 + y^2)\rho(x, y, z)\, dV. \qquad \text{Moment of inertia about } z\text{-axis}$$

REMARK In engineering and physics, the moment of inertia of a mass is used to find the time required for the mass to reach a given speed of rotation about an axis, as shown in Figure 14.60. The greater the moment of inertia, the longer a force must be applied for the mass to reach the given speed.

Figure 14.60

For problems requiring the calculation of all three moments, considerable effort can be saved by applying the additive property of triple integrals and writing

$$I_x = I_{xz} + I_{xy}, \quad I_y = I_{yz} + I_{xy}, \quad \text{and} \quad I_z = I_{yz} + I_{xz}$$

where I_{xy}, I_{xz}, and I_{yz} are

$$I_{xy} = \iiint_Q z^2\rho(x, y, z)\, dV$$

$$I_{xz} = \iiint_Q y^2\rho(x, y, z)\, dV$$

and

$$I_{yz} = \iiint_Q x^2\rho(x, y, z)\, dV.$$

Variable density:
$\rho(x, y, z) = k(x^2 + y^2 + z^2)$
Figure 14.61

EXAMPLE 5 Finding the Center of Mass of a Solid Region

See LarsonCalculus.com for an interactive version of this type of example.

Find the center of mass of the unit cube shown in Figure 14.61, given that the density at the point (x, y, z) is proportional to the square of its distance from the origin.

Solution Because the density at (x, y, z) is proportional to the square of the distance between $(0, 0, 0)$ and (x, y, z), you have

$$\rho(x, y, z) = k(x^2 + y^2 + z^2)$$

where k is the constant of proportionality. You can use this density function to find the mass of the cube. Because of the symmetry of the region, any order of integration will produce an integral of comparable difficulty.

$$m = \int_0^1 \int_0^1 \int_0^1 k(x^2 + y^2 + z^2)\, dz\, dy\, dx$$ Apply formula for mass of a solid.

$$= k\int_0^1 \int_0^1 \left[(x^2 + y^2)z + \frac{z^3}{3}\right]_0^1 dy\, dx$$ Integrate with respect to z.

$$= k\int_0^1 \int_0^1 \left(x^2 + y^2 + \frac{1}{3}\right) dy\, dx$$

$$= k\int_0^1 \left[\left(x^2 + \frac{1}{3}\right)y + \frac{y^3}{3}\right]_0^1 dx$$ Integrate with respect to y.

$$= k\int_0^1 \left(x^2 + \frac{2}{3}\right) dx$$

$$= k\left[\frac{x^3}{3} + \frac{2x}{3}\right]_0^1$$ Integrate with respect to x.

$$= k$$

The first moment about the yz-plane is

$$M_{yz} = k\int_0^1 \int_0^1 \int_0^1 x(x^2 + y^2 + z^2)\, dz\, dy\, dx$$ Apply formula for first moment about yz-plane.

$$= k\int_0^1 x\left[\int_0^1 \int_0^1 (x^2 + y^2 + z^2)\, dz\, dy\right] dx.$$ Factor.

Note that x can be factored out of the two inner integrals, because it is constant with respect to y and z. After factoring, the two inner integrals are the same as for the mass m. Therefore, you have

$$M_{yz} = k\int_0^1 x\left(x^2 + \frac{2}{3}\right) dx$$

$$= k\left[\frac{x^4}{4} + \frac{x^2}{3}\right]_0^1$$ Integrate with respect to x.

$$= \frac{7k}{12}.$$ First moment about yz-plane

So,

$$\bar{x} = \frac{M_{yz}}{m} = \frac{7k/12}{k} = \frac{7}{12}.$$

Finally, from the nature of ρ and the symmetry of x, y, and z in this solid region, you have $\bar{x} = \bar{y} = \bar{z}$, and the center of mass is $\left(\frac{7}{12}, \frac{7}{12}, \frac{7}{12}\right)$. ■

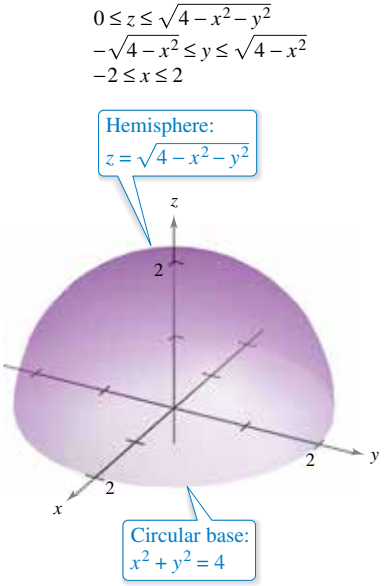
EXAMPLE 6 Moments of Inertia for a Solid Region

Find the moments of inertia about the x- and y-axes for the solid region lying between the hemisphere

$$z = \sqrt{4 - x^2 - y^2}$$

and the xy-plane, given that the density at (x, y, z) is proportional to the distance between (x, y, z) and the xy-plane.



Variable density: $\rho(x, y, z) = kz$
Figure 14.62

Solution The density of the region is given by

$$\rho(x, y, z) = kz$$

where k is the constant of proportionality. Considering the symmetry of this problem, you know that $I_x = I_y$, and you need to find only one moment, such as I_x. From Figure 14.62, choose the order $dz\,dy\,dx$ and write

$$I_x = \iiint_Q (y^2 + z^2)\rho(x, y, z)\,dV \qquad \text{Moment of inertia about } x\text{-axis}$$

$$= \int_{-2}^{2}\int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}}\int_{0}^{\sqrt{4-x^2-y^2}} (y^2 + z^2)(kz)\,dz\,dy\,dx$$

$$= k\int_{-2}^{2}\int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}}\left[\frac{y^2z^2}{2} + \frac{z^4}{4}\right]_0^{\sqrt{4-x^2-y^2}} dy\,dx$$

$$= k\int_{-2}^{2}\int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}}\left[\frac{y^2(4 - x^2 - y^2)}{2} + \frac{(4 - x^2 - y^2)^2}{4}\right] dy\,dx$$

$$= \frac{k}{4}\int_{-2}^{2}\int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}}[(4 - x^2)^2 - y^4]\,dy\,dx$$

$$= \frac{k}{4}\int_{-2}^{2}\left[(4 - x^2)^2 y - \frac{y^5}{5}\right]_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dx$$

$$= \frac{k}{4}\int_{-2}^{2}\frac{8}{5}(4 - x^2)^{5/2}\,dx$$

$$= \frac{4k}{5}\int_{0}^{2}(4 - x^2)^{5/2}\,dx$$

$$= \frac{4k}{5}\int_{0}^{\pi/2} 64\cos^6\theta\,d\theta \qquad \text{Trigonometric substitution: } x = 2\sin\theta$$

$$= \left(\frac{256k}{5}\right)\left(\frac{5\pi}{32}\right) \qquad \text{Wallis's Formula}$$

$$= 8k\pi.$$

So, $I_x = 8k\pi = I_y$. ■

In Example 6, notice that the moments of inertia about the x- and y-axes are equal to each other. The moment about the z-axis, however, is different. Does it seem that the moment of inertia about the z-axis should be less than or greater than the moments calculated in Example 6? By performing the calculations, you can determine that

$$I_z = \frac{16}{3}k\pi.$$

This tells you that the solid shown in Figure 14.62 has a greater resistance to rotation about the x- or y-axis than about the z-axis.

Concept Check

1. What does $Q = \iiint_Q dV$ represent?
2. Explain why it is beneficial to be able to change the order of integration for a triple integral.

Evaluating a Triple Iterated Integral **In Exercises 3–10, evaluate the triple iterated integral.**

3. $\int_0^3 \int_0^2 \int_0^1 (x + y + z)\, dx\, dz\, dy$
4. $\int_0^2 \int_0^1 \int_{-1}^2 xyz^3\, dx\, dy\, dz$
5. $\int_0^1 \int_0^x \int_0^{\sqrt{x}y} x\, dz\, dy\, dx$
6. $\int_0^9 \int_0^{y/3} \int_0^{\sqrt{y^2-9x^2}} z\, dz\, dx\, dy$
7. $\int_1^4 \int_0^1 \int_0^x 2ze^{-x^2}\, dy\, dx\, dz$
8. $\int_1^4 \int_1^{e^2} \int_0^{1/xz} \ln z\, dy\, dz\, dx$
9. $\int_{-3}^4 \int_0^{\pi/2} \int_0^{1+3x} x \cos y\, dz\, dy\, dx$
10. $\int_0^{\pi/2} \int_0^{y/2} \int_0^{1/y} \sin y\, dz\, dx\, dy$

Evaluating a Triple Iterated Integral Using Technology **In Exercises 11 and 12, use a graphing utility to evaluate the triple iterated integral.**

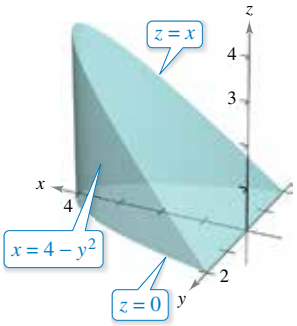
11. $\int_0^3 \int_{-\sqrt{9-y^2}}^{\sqrt{9-y^2}} \int_0^{y^2} y\, dz\, dx\, dy$
12. $\int_0^3 \int_0^{2-(2y/3)} \int_0^{6-2y-3z} ze^{-x^2y^2}\, dx\, dz\, dy$

Setting Up a Triple Integral **In Exercises 13–18, set up a triple integral for the volume of the solid. Do not evaluate the integral.**

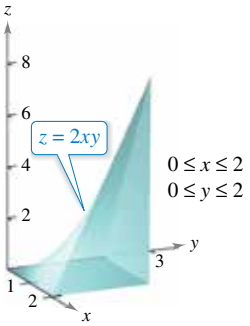
13. The solid in the first octant bounded by the coordinate planes and the plane $z = 7 - x - 2y$
14. The solid bounded by $z = 9 - x^2$, $z = 0$, $y = 0$, and $y = 2x$
15. The solid bounded by $z = 6 - x^2 - y^2$ and $z = 0$
16. The solid bounded by $z = \sqrt{1 - x^2 - y^2}$ and $z = 0$
17. The solid that is the common interior below the sphere $x^2 + y^2 + z^2 = 80$ and above the paraboloid $z = \frac{1}{2}(x^2 + y^2)$
18. The solid bounded above by the cylinder $z = 4 - x^2$ and below by the paraboloid $z = x^2 + 3y^2$

Volume **In Exercises 19–24, use a triple integral to find the volume of the solid bounded by the graphs of the equations.**

19.



20.



21. $z = 6x^2$, $y = 3 - 3x$, first octant
22. $z = 9 - x^3$, $y = -x^2 + 2$, $y = 0$, $z = 0$, $x \geq 0$
23. $z = 2 - y$, $z = 4 - y^2$, $x = 0$, $x = 3$, $y = 0$
24. $z = \sqrt{x}$, $y = x + 2$, $y = x^2$, first octant

Changing the Order of Integration **In Exercises 25–30, sketch the solid whose volume is given by the iterated integral. Then rewrite the integral using the indicated order of integration.**

25. $\int_0^1 \int_{-1}^0 \int_0^{y^2} dz\, dy\, dx$

Rewrite using $dy\, dz\, dx$.

26. $\int_{-1}^1 \int_{y^2}^1 \int_0^{1-x} dz\, dx\, dy$

Rewrite using $dx\, dz\, dy$.

27. $\int_0^4 \int_0^{(4-x)/2} \int_0^{(12-3x-6y)/4} dz\, dy\, dx$

Rewrite using $dy\, dx\, dz$.

28. $\int_0^3 \int_0^{\sqrt{9-x^2}} \int_0^{6-x-y} dz\, dy\, dx$

Rewrite using $dz\, dx\, dy$.

29. $\int_0^1 \int_y^1 \int_0^{\sqrt{1-y^2}} dz\, dx\, dy$

Rewrite using $dz\, dy\, dx$.

30. $\int_0^2 \int_{2x}^4 \int_0^{\sqrt{y^2-4x^2}} dz\, dy\, dx$

Rewrite using $dx\, dy\, dz$.

Orders of Integration **In Exercises 31–34, write a triple integral for $f(x, y, z) = xyz$ over the solid region Q for each of the six possible orders of integration. Then evaluate one of the triple integrals.**

31. $Q = \{(x, y, z):\ 0 \leq x \leq 1, 0 \leq y \leq 5x, 0 \leq z \leq 3\}$
32. $Q = \{(x, y, z):\ 0 \leq x \leq 2, x^2 \leq y \leq 4, 0 \leq z \leq 2 - x\}$
33. $Q = \{(x, y, z):\ x^2 + y^2 \leq 9, 0 \leq z \leq 4\}$
34. $Q = \{(x, y, z):\ 0 \leq x \leq 1, 0 \leq y \leq 1 - x^2, 0 \leq z \leq 6\}$

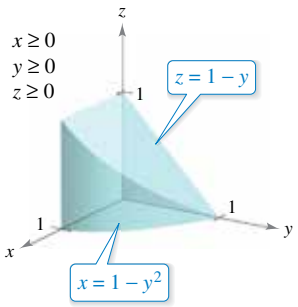
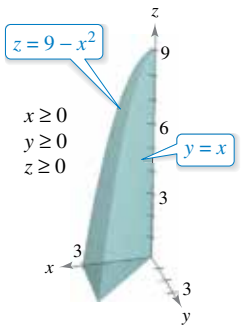
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Orders of Integration **In Exercises 35 and 36, the figure shows the region of integration for the given integral. Rewrite the integral as an equivalent iterated integral in the five other orders.**

35. $\int_0^1 \int_0^{1-y^2} \int_0^{1-y} dz\, dx\, dy$



36. $\int_0^3 \int_0^x \int_0^{9-x^2} dz\, dy\, dx$



Center of Mass **In Exercises 37–40, find the mass and the indicated coordinate of the center of mass of the solid region Q of density ρ bounded by the graphs of the equations.**

37. Find $\bar{x}$ using $\rho(x, y, z) = k$.

Q: $2x + 3y + 6z = 12,\ x = 0,\ y = 0,\ z = 0$

38. Find $\bar{y}$ using $\rho(x, y, z) = ky$.

Q: $3x + 3y + 5z = 15,\ x = 0,\ y = 0,\ z = 0$

39. Find $\bar{z}$ using $\rho(x, y, z) = kx$.

Q: $z = 4 - x,\ z = 0,\ y = 0,\ y = 4,\ x = 0$

40. Find $\bar{y}$ using $\rho(x, y, z) = k$.

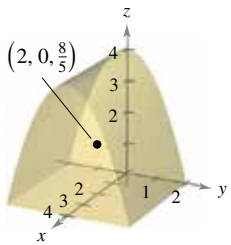
Q: $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1\ (a, b, c > 0),\ x = 0,\ y = 0,\ z = 0$

Center of Mass **In Exercises 41 and 42, set up the triple integrals for finding the mass and the center of mass of the solid of density ρ bounded by the graphs of the equations. Do not evaluate the integrals.**

41. $x = 0,\ x = b,\ y = 0,\ y = b,\ z = 0,\ z = b,\ \rho(x, y, z) = kxy$

42. $x = 0,\ x = a,\ y = 0,\ y = b,\ z = 0,\ z = c,\ \rho(x, y, z) = kz$

Think About It **The center of mass of a solid of constant density is shown in the figure. In Exercises 43–46, make a conjecture about how the center of mass $(\bar{x}, \bar{y}, \bar{z})$ will change for the nonconstant density $\rho(x, y, z)$. Explain. (Make your conjecture *without* performing any calculations.)**



43. $\rho(x, y, z) = kx$

44. $\rho(x, y, z) = kz$

45. $\rho(x, y, z) = k(y + 2)$

46. $\rho(x, y, z) = kxz^2(y + 2)^2$

Centroid **In Exercises 47–52, find the centroid of the solid region bounded by the graphs of the equations or described by the figure. Use a graphing utility to evaluate the triple integrals. (Assume uniform density and find the center of mass.)**

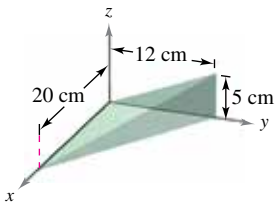
47. $z = \frac{h}{r}\sqrt{x^2 + y^2},\ z = h$

48. $y = \sqrt{9 - x^2},\ z = y,\ z = 0$

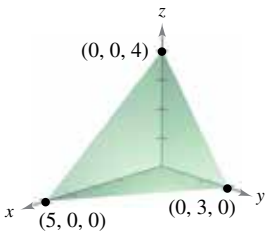
49. $z = \sqrt{16 - x^2 - y^2},\ z = 0$

50. $z = \frac{1}{y^2 + 1},\ z = 0,\ x = -2,\ x = 2,\ y = 0,\ y = 1$

51.



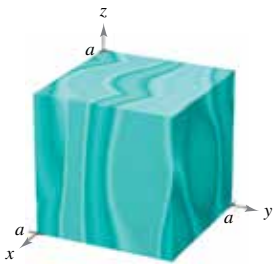
52.



Moments of Inertia **In Exercises 53–56, find I_x, I_y, and I_z for the solid of given density. Use a graphing utility to evaluate the triple integrals.**

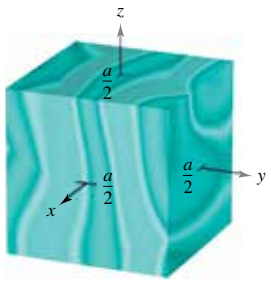
53. (a) $\rho = k$

(b) $\rho = kxyz$



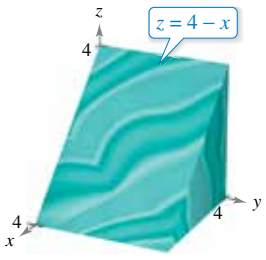
54. (a) $\rho(x, y, z) = k$

(b) $\rho(x, y, z) = k(x^2 + y^2)$



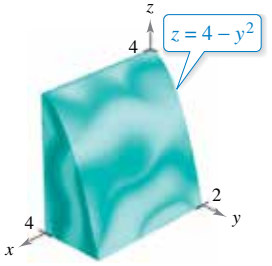
55. (a) $\rho(x, y, z) = k$

(b) $\rho = ky$



56. (a) $\rho = kz$

(b) $\rho = k(4 - z)$



Moments of Inertia **In Exercises 57 and 58, verify the moments of inertia for the solid of uniform density. Use a graphing utility to evaluate the triple integrals.**

57. $I_x = \frac{1}{12}m(3a^2 + L^2)$

$I_y = \frac{1}{2}ma^2$

$I_z = \frac{1}{12}m(3a^2 + L^2)$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

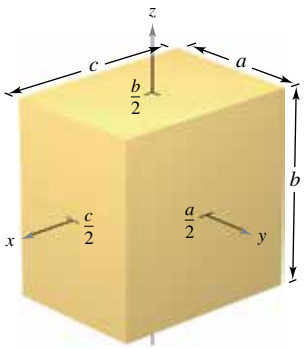
58. $I_x = \frac{1}{12}m(a^2 + b^2)$
$I_y = \frac{1}{12}m(b^2 + c^2)$
$I_z = \frac{1}{12}m(a^2 + c^2)$



Moments of Inertia **In Exercises 59 and 60, set up a triple integral for the moment of inertia about the z-axis of the solid region Q of density ρ. Do not evaluate the integral.**

59. $Q = \{(x, y, z): -1 \le x \le 1, -1 \le y \le 1, 0 \le z \le 1 - x\}$
$\rho = \sqrt{x^2 + y^2 + z^2}$

60. $Q = \{(x, y, z): x^2 + y^2 \le 1, 0 \le z \le 4 - x^2 - y^2\}$
$\rho = kx^2$

Setting Up Triple Integrals **In Exercises 61 and 62, use the description of the solid region to set up the triple integral for (a) the mass, (b) the center of mass, and (c) the moment of inertia about the z-axis. Do not evaluate the integrals.**

61. The solid bounded by $z = 4 - x^2 - y^2$ and $z = 0$ with density $\rho(x, y, z) = kz$

62. The solid in the first octant bounded by the coordinate planes and $x^2 + y^2 + z^2 = 25$ with density $\rho(x, y, z) = kxy$

Average Value **In Exercises 63–66, find the average value of the function over the given solid region. The average value of a continuous function $f(x, y, z)$ over a solid region Q is**

$$\text{Average value} = \frac{1}{V}\iiint_Q f(x, y, z)\, dV$$

where V is the volume of the solid region Q.

63. $f(x, y, z) = z^2 + 4$ over the cube in the first octant bounded by the coordinate planes and the planes $x = 1$, $y = 1$, and $z = 1$

64. $f(x, y, z) = xyz$ over the cube in the first octant bounded by the coordinate planes and the planes $x = 4$, $y = 4$, and $z = 4$

65. $f(x, y, z) = x + y + z$ over the tetrahedron in the first octant with vertices $(0, 0, 0)$, $(2, 0, 0)$, $(0, 2, 0)$, and $(0, 0, 2)$

66. $f(x, y, z) = x + y$ over the solid bounded by the sphere $x^2 + y^2 + z^2 = 3$

Exploring Concepts

67. Determine whether the moment of inertia about the y-axis of the cylinder in Exercise 57 will increase or decrease for the nonconstant density $\rho(x, y, z) = \sqrt{x^2 + z^2}$.

68. Find the volume of the sphere $x^2 + y^2 + z^2 = 9$ using the shell method and using a triple integral. Compare your answers.

Exploring Concepts (continued)

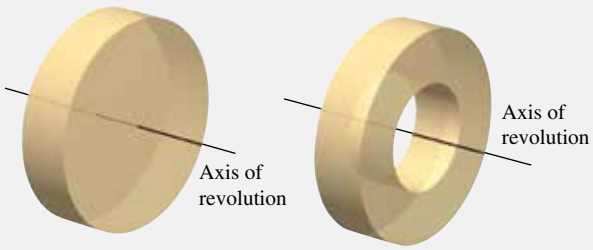
69. Which of the integrals below is equal to $\int_1^3 \int_0^2 \int_{-1}^1 f(x, y, z)\, dz\, dy\, dx$? Explain.

(a) $\int_1^3 \int_0^2 \int_{-1}^1 f(x, y, z)\, dz\, dx\, dy$

(b) $\int_{-1}^1 \int_0^2 \int_1^3 f(x, y, z)\, dx\, dy\, dz$

(c) $\int_0^2 \int_1^3 \int_{-1}^1 f(x, y, z)\, dy\, dx\, dz$

70. **HOW DO YOU SEE IT?** Consider two solids of equal weight, as shown below.



Solid A Solid B

(a) Which solid has the greater density? Explain.

(b) Which solid has the greater moment of inertia? Explain.

(c) The solids are rolled down an inclined plane. They are started at the same time and at the same height. Which will reach the bottom first? Explain.

71. Maximizing a Triple Integral Find the solid region Q where the triple integral

$$\iiint_Q (1 - 2x^2 - y^2 - 3z^2)\, dV$$

is a maximum. Use a graphing utility to approximate the maximum value. What is the exact maximum value?

72. Finding a Value Solve for a in the triple integral.

$$\int_0^1 \int_0^{3-a-y^2} \int_a^{4-x-y^2} dz\, dx\, dy = \frac{14}{15}$$

PUTNAM EXAM CHALLENGE

73. Evaluate

$$\lim_{n\to\infty} \int_0^1 \int_0^1 \cdots \int_0^1 \cos^2\left\{\frac{\pi}{2n}(x_1 + x_2 + \cdots + x_n)\right\} dx_1\, dx_2 \cdots dx_n.$$

14.7 Triple Integrals in Other Coordinates

GO DIGITAL

- **Write and evaluate a triple integral in cylindrical coordinates.**
- **Write and evaluate a triple integral in spherical coordinates.**

PIERRE SIMON DE LAPLACE (1749–1827)

One of the first to use a cylindrical coordinate system was the French mathematician Pierre Simon de Laplace. Laplace has been called the "Newton of France," and he published many important works in mechanics, differential equations, and probability.

See LarsonCalculus.com to read more of this biography.

Triple Integrals in Cylindrical Coordinates

Many common solid regions, such as spheres, ellipsoids, cones, and paraboloids, can yield difficult triple integrals in rectangular coordinates. In fact, it is precisely this difficulty that led to the introduction of nonrectangular coordinate systems. In this section, you will learn how to use *cylindrical* and *spherical* coordinates to evaluate triple integrals.

Recall from Section 11.7 that the rectangular conversion equations for cylindrical coordinates are

$$x = r\cos\theta$$
$$y = r\sin\theta$$
$$z = z.$$

An easy way to remember these conversions is to note that the equations for x and y are the same as in polar coordinates and z is unchanged.

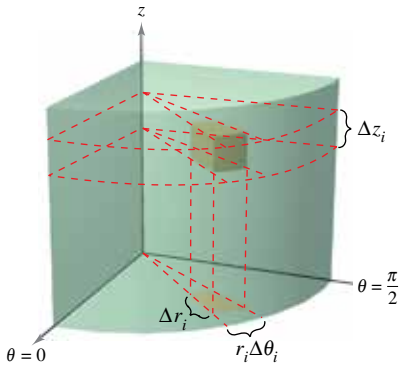
In this coordinate system, the simplest solid region is a cylindrical block determined by

$$r_1 \le r \le r_2$$
$$\theta_1 \le \theta \le \theta_2$$

and

$$z_1 \le z \le z_2$$

as shown in Figure 14.63.



Volume of cylindrical block:
$\Delta V_i = r_i \Delta r_i \Delta\theta_i \Delta z_i$

Figure 14.63

To obtain the cylindrical coordinate form of a triple integral, consider a solid region Q whose projection R onto the xy-plane can be described in polar coordinates. That is,

$$Q = \{(x, y, z):\ (x, y) \text{ is in } R,\quad h_1(x, y) \le z \le h_2(x, y)\}$$

and

$$R = \{(r, \theta):\ \theta_1 \le \theta \le \theta_2,\quad g_1(\theta) \le r \le g_2(\theta)\}.$$

If f is a continuous function on the solid Q, then you can write the triple integral of f over Q as

$$\iiint_Q f(x, y, z)\,dV = \int_R\int\left[\int_{h_1(x,\,y)}^{h_2(x,\,y)} f(x, y, z)\,dz\right]dA$$

where the double integral over R is evaluated in polar coordinates. That is, R is a plane region that is either r-simple or θ-simple (see Section 14.3). If R is r-simple, then the iterated form of the triple integral in cylindrical form is

$$\iiint_Q f(x, y, z)\,dV = \int_{\theta_1}^{\theta_2}\int_{g_1(\theta)}^{g_2(\theta)}\int_{h_1(r\cos\theta,\,r\sin\theta)}^{h_2(r\cos\theta,\,r\sin\theta)} f(r\cos\theta, r\sin\theta, z)\,r\,dz\,dr\,d\theta.$$

This is only one of six possible orders of integration. The other five are $dz\,d\theta\,dr$, $dr\,dz\,d\theta$, $dr\,d\theta\,dz$, $d\theta\,dz\,dr$, and $d\theta\,dr\,dz$.

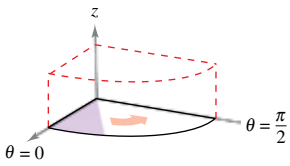
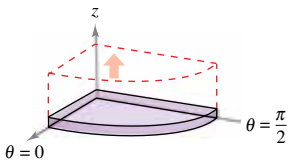
Integrate with respect to r.



Integrate with respect to θ.



Integrate with respect to z.

Figure 14.64

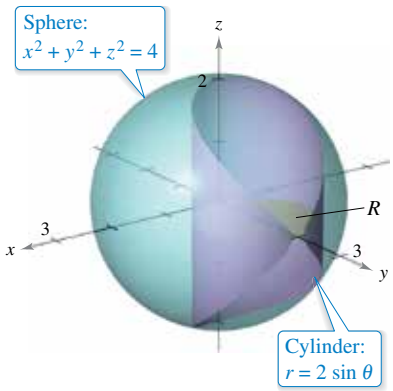


Figure 14.65

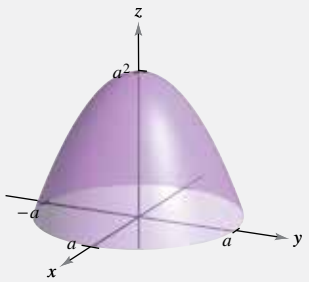
To visualize a particular order of integration, it helps to view the iterated integral in terms of three sweeping motions, each adding another dimension to the solid. For instance, in the order $dr\,d\theta\,dz$, the first integration occurs in the r-direction as a point sweeps out a ray. Then, as θ increases, the line sweeps out a sector. Finally, as z increases, the sector sweeps out a solid wedge, as shown in Figure 14.64.

Exploration

Volume of a Paraboloid Sector In the Explorations on pages 983, 992, and 1014, you were asked to summarize the different ways you know of finding the volume of the solid bounded by the paraboloid

$$z = a^2 - x^2 - y^2, \quad a > 0$$

and the xy-plane. You now know one more way. Use it to find the volume of the solid. Compare the different methods. What are the advantages and disadvantages of each?



EXAMPLE 1 Finding Volume in Cylindrical Coordinates

Find the volume of the solid region Q cut from the sphere $x^2 + y^2 + z^2 = 4$ by the cylinder $r = 2 \sin\theta$, as shown in Figure 14.65.

Solution Because $x^2 + y^2 + z^2 = r^2 + z^2 = 4$, the bounds on z are

$$-\sqrt{4 - r^2} \le z \le \sqrt{4 - r^2}. \qquad \text{Bounds for } z$$

Let R be the circular projection of the solid onto the $r\theta$-plane. Then the bounds on R are

$$0 \le r \le 2\sin\theta \quad \text{and} \quad 0 \le \theta \le \pi. \qquad \text{Bounds for } R$$

So, the volume of Q is

$$V = \int_0^{\pi}\int_0^{2\sin\theta}\int_{-\sqrt{4-r^2}}^{\sqrt{4-r^2}} r\,dz\,dr\,d\theta \qquad \text{Apply formula for volume.}$$

$$= 2\int_0^{\pi/2}\int_0^{2\sin\theta}\int_{-\sqrt{4-r^2}}^{\sqrt{4-r^2}} r\,dz\,dr\,d\theta \qquad \text{Use symmetry to rewrite bounds for } \theta.$$

$$= 2\int_0^{\pi/2}\int_0^{2\sin\theta} 2r\sqrt{4 - r^2}\,dr\,d\theta \qquad \text{Integrate with respect to } z.$$

$$= 2\int_0^{\pi/2} -\frac{2}{3}(4 - r^2)^{3/2}\Big]_0^{2\sin\theta} d\theta \qquad \text{Integrate with respect to } r.$$

$$= \frac{4}{3}\int_0^{\pi/2} (8 - 8\cos^3\theta)\,d\theta$$

$$= \frac{32}{3}\int_0^{\pi/2} [1 - (\cos\theta)(1 - \sin^2\theta)]\,d\theta \qquad \text{Factor and use trigonometric identity } \cos^2\theta = 1 - \sin^2\theta.$$

$$= \frac{32}{3}\left[\theta - \sin\theta + \frac{\sin^3\theta}{3}\right]_0^{\pi/2} \qquad \text{Integrate with respect to } \theta.$$

$$= \frac{16}{9}(3\pi - 4)$$

$$\approx 9.644.$$

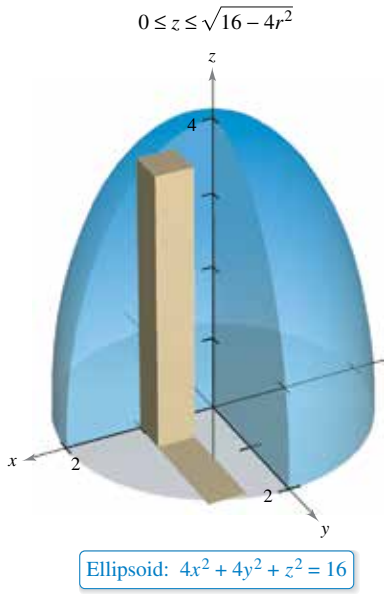

Figure 14.66

EXAMPLE 2 Finding Mass in Cylindrical Coordinates

Find the mass of the ellipsoid Q given by $4x^2 + 4y^2 + z^2 = 16$, lying above the xy-plane. The density at a point in the solid is proportional to the distance between the point and the xy-plane.

Solution The density function is $\rho(r, \theta, z) = kz$, where k is the constant of proportionality. The bounds on z are

$$0 \le z \le \sqrt{16 - 4x^2 - 4y^2} = \sqrt{16 - 4r^2}$$

where $0 \le r \le 2$ and $0 \le \theta \le 2\pi$, as shown in Figure 14.66. The mass of the solid is

$$\begin{aligned}
m &= \int_0^{2\pi}\int_0^{2}\int_0^{\sqrt{16-4r^2}} kzr\,dz\,dr\,d\theta && \text{Apply formula for mass of a solid.}\\
&= \frac{k}{2}\int_0^{2\pi}\int_0^{2} z^2 r\Big]_0^{\sqrt{16-4r^2}}\,dr\,d\theta && \text{Integrate with respect to } z.\\
&= \frac{k}{2}\int_0^{2\pi}\int_0^{2} (16r - 4r^3)\,dr\,d\theta\\
&= \frac{k}{2}\int_0^{2\pi}\Big[8r^2 - r^4\Big]_0^{2}\,d\theta && \text{Integrate with respect to } r.\\
&= 8k\int_0^{2\pi} d\theta\\
&= 16\pi k. && \text{Integrate with respect to } \theta.
\end{aligned}$$

Integration in cylindrical coordinates is useful when factors involving $x^2 + y^2$ appear in the integrand, as illustrated in Example 3.

EXAMPLE 3 Finding a Moment of Inertia

Find the moment of inertia about the axis of symmetry of the solid Q bounded by the paraboloid $z = x^2 + y^2$ and the plane $z = 4$, as shown in Figure 14.67. The density at each point is proportional to the distance between the point and the z-axis.

Solution Because the z-axis is the axis of symmetry and $\rho(x, y, z) = k\sqrt{x^2 + y^2}$, where k is the constant of proportionality, it follows that

$$I_z = \iiint_Q k(x^2 + y^2)\sqrt{x^2 + y^2}\,dV. \qquad \text{Moment of inertia about } z\text{-axis}$$

In cylindrical coordinates, $0 \le r \le \sqrt{x^2 + y^2} = \sqrt{z}$ and $0 \le \theta \le 2\pi$. So, you have

$$\begin{aligned}
I_z &= k\int_0^{4}\int_0^{2\pi}\int_0^{\sqrt{z}} r^2(r)r\,dr\,d\theta\,dz && \text{Cylindrical coordinates}\\
&= k\int_0^{4}\int_0^{2\pi} \frac{r^5}{5}\Big]_0^{\sqrt{z}}\,d\theta\,dz && \text{Integrate with respect to } r.\\
&= k\int_0^{4}\int_0^{2\pi} \frac{z^{5/2}}{5}\,d\theta\,dz\\
&= \frac{k}{5}\int_0^{4} z^{5/2}(2\pi)\,dz && \text{Integrate with respect to } \theta.\\
&= \frac{2\pi k}{5}\left[\frac{2}{7}z^{7/2}\right]_0^{4} && \text{Integrate with respect to } z.\\
&= \frac{512k\pi}{35}.
\end{aligned}$$

Triple Integrals in Spherical Coordinates

Triple integrals involving spheres or cones are often easier to evaluate by converting to spherical coordinates. Recall from Section 11.7 that the rectangular conversion equations for spherical coordinates are

$$x = \rho \sin\phi \cos\theta$$
$$y = \rho \sin\phi \sin\theta$$
$$z = \rho \cos\phi.$$

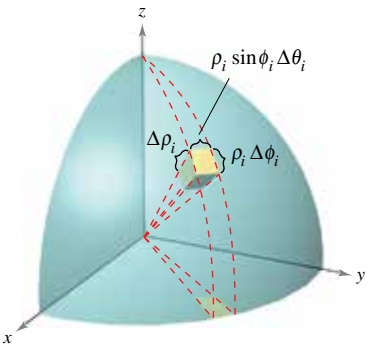
REMARK The Greek letter ρ used in spherical coordinates is not related to density. Rather, it is the three-dimensional analog of the r used in polar coordinates. For problems involving spherical coordinates and a density function, this text uses a different symbol to denote density.

In this coordinate system, the simplest region is a spherical block determined by

$$\{(\rho, \theta, \phi):\ \rho_1 \le \rho \le \rho_2,\quad \theta_1 \le \theta \le \theta_2,\quad \phi_1 \le \phi \le \phi_2\}$$

where $\rho_1 \ge 0$, $\theta_2 - \theta_1 \le 2\pi$, and $0 \le \phi_1 \le \phi_2 \le \pi$, as shown in Figure 14.68. If (ρ, θ, ϕ) is a point in the interior of such a block, then the volume of the block can be approximated by $\Delta V \approx \rho^2 \sin\phi \Delta\rho \Delta\phi \Delta\theta$. (See Exercise 6 in the P.S. Problem Solving exercises at the end of this chapter.)

Using the usual process involving an inner partition, summation, and a limit, you can develop a triple integral in spherical coordinates for a continuous function f defined on the solid region Q. This formula, shown below, can be modified for different orders of integration and generalized to include regions with variable boundaries.



Spherical block: $\Delta V_i \approx \rho_i^2 \sin\phi_i \Delta\rho_i \Delta\phi_i \Delta\theta_i$

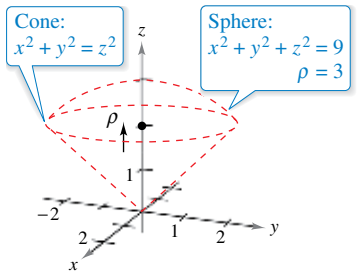
Figure 14.68

$$\iiint_Q f(x, y, z)\, dV = \int_{\theta_1}^{\theta_2} \int_{\phi_1}^{\phi_2} \int_{\rho_1}^{\rho_2} f(\rho \sin\phi \cos\theta, \rho \sin\phi \sin\theta, \rho \cos\phi)\rho^2 \sin\phi\, d\rho\, d\phi\, d\theta$$

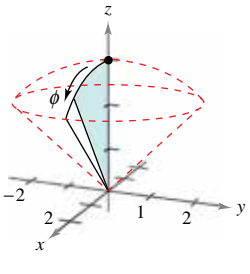
Like triple integrals in cylindrical coordinates, triple integrals in spherical coordinates are evaluated with iterated integrals. As with cylindrical coordinates, you can visualize a particular order of integration by viewing the iterated integral in terms of three sweeping motions, each adding another dimension to the solid. For instance, the iterated integral

$$\int_0^{2\pi} \int_0^{\pi/4} \int_0^3 \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta$$

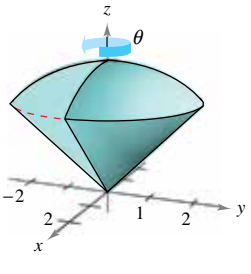
(which is used in Example 4) is illustrated in Figure 14.69.



ρ varies from 0 to 3 with ϕ and θ held constant.



ϕ varies from 0 to $\pi/4$ with θ held constant.



θ varies from 0 to 2π.

Figure 14.69

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

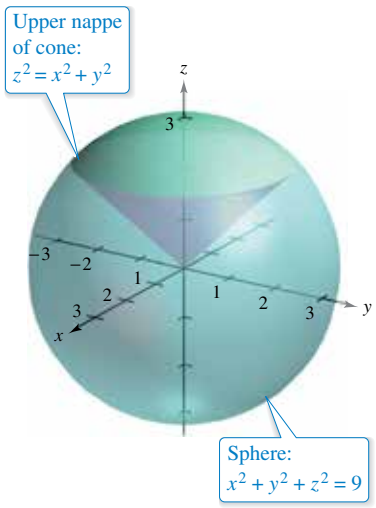

Figure 14.70

EXAMPLE 4 Finding Volume in Spherical Coordinates

Find the volume of the solid region Q bounded below by the upper nappe of the cone $z^2 = x^2 + y^2$ and above by the sphere $x^2 + y^2 + z^2 = 9$, as shown in Figure 14.70.

Solution In spherical coordinates, the equation of the sphere is

$$\rho^2 = x^2 + y^2 + z^2 = 9 \quad \Rightarrow \quad \rho = 3.$$

Furthermore, the sphere and cone intersect when

$$(x^2 + y^2) + z^2 = (z^2) + z^2 = 9 \quad \Rightarrow \quad z = \frac{3}{\sqrt{2}}$$

and, because $z = \rho \cos\phi$, it follows that

$$\left(\frac{3}{\sqrt{2}}\right)\left(\frac{1}{3}\right) = \cos\phi \quad \Rightarrow \quad \phi = \frac{\pi}{4}.$$

Consequently, you can use the integration order $d\rho\, d\phi\, d\theta$, where $0 \le \rho \le 3$, $0 \le \phi \le \pi/4$, and $0 \le \theta \le 2\pi$. The volume is

$$\begin{aligned}
V &= \int_0^{2\pi}\int_0^{\pi/4}\int_0^3 \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta && \text{Apply formula for volume.}\\
&= \int_0^{2\pi}\int_0^{\pi/4} 9\sin\phi\, d\phi\, d\theta && \text{Integrate with respect to } \rho.\\
&= 9\int_0^{2\pi} -\cos\phi\Big]_0^{\pi/4} d\theta && \text{Integrate with respect to } \phi.\\
&= 9\int_0^{2\pi}\left(1 - \frac{\sqrt{2}}{2}\right) d\theta\\
&= 9\pi\left(2 - \sqrt{2}\right) && \text{Integrate with respect to } \theta.\\
&\approx 16.563.
\end{aligned}$$

EXAMPLE 5 Finding the Center of Mass of a Solid Region

See LarsonCalculus.com for an interactive version of this type of example.

Find the center of mass of the solid region Q of uniform density from Example 4.

Solution Because the density is uniform, you can consider the density at the point (x, y, z) to be k. By symmetry, the center of mass lies on the z-axis, and you need only calculate $\bar{z} = M_{xy}/m$, where $m = kV = 9k\pi\left(2 - \sqrt{2}\right)$. Because $z = \rho\cos\phi$, it follows that

$$\begin{aligned}
M_{xy} &= \iiint_Q kz\, dV = k\int_0^3\int_0^{2\pi}\int_0^{\pi/4} (\rho\cos\phi)\rho^2\sin\phi\, d\phi\, d\theta\, d\rho\\
&= k\int_0^3\int_0^{2\pi} \rho^3 \frac{\sin^2\phi}{2}\Big]_0^{\pi/4} d\theta\, d\rho\\
&= \frac{k}{4}\int_0^3\int_0^{2\pi} \rho^3\, d\theta\, d\rho = \frac{k\pi}{2}\int_0^3 \rho^3\, d\rho = \frac{81k\pi}{8}.
\end{aligned}$$

So,

$$\bar{z} = \frac{M_{xy}}{m} = \frac{81k\pi/8}{9k\pi\left(2 - \sqrt{2}\right)} = \frac{9\left(2 + \sqrt{2}\right)}{16} \approx 1.920$$

and the center of mass is approximately $(0, 0, 1.920)$. ■

GO DIGITAL

Concept Check

1. Explain why triple integrals that represent the volumes of solids are sometimes easier to evaluate in cylindrical or spherical coordinates instead of rectangular coordinates.
2. What is the differential of volume, dV, for (a) cylindrical coordinates and (b) spherical coordinates? Choose one order of integration for each system.

Evaluating a Triple Iterated Integral **In Exercises 3–8, evaluate the triple iterated integral.**

3. $\int_{-1}^{5}\int_{0}^{\pi/2}\int_{0}^{3} r\cos\theta\, dr\, d\theta\, dz$
4. $\int_{0}^{\pi/4}\int_{0}^{6}\int_{0}^{6-r} rz\, dz\, dr\, d\theta$
5. $\int_{0}^{\pi/2}\int_{0}^{\cos\theta}\int_{0}^{3+r^2} 2r\sin\theta\, dz\, dr\, d\theta$
6. $\int_{0}^{\pi/2}\int_{0}^{\pi}\int_{0}^{2} e^{-\rho^3}\rho^2\, d\rho\, d\theta\, d\phi$
7. $\int_{0}^{2\pi}\int_{0}^{\pi/2}\int_{0}^{\sin\phi} \rho\cos\phi\, d\rho\, d\phi\, d\theta$
8. $\int_{0}^{\pi/4}\int_{0}^{\pi/4}\int_{0}^{\cos\theta} \rho^2\sin\phi\cos\phi\, d\rho\, d\theta\, d\phi$

Evaluating a Triple Iterated Integral Using Technology **In Exercises 9 and 10, use a graphing utility to evaluate the triple iterated integral.**

9. $\int_{0}^{4}\int_{0}^{z}\int_{0}^{\pi/2} re^{r}\, d\theta\, dr\, dz$
10. $\int_{0}^{\pi/2}\int_{0}^{\pi}\int_{0}^{\sin\theta} 2\rho^2\cos\phi\, d\rho\, d\theta\, d\phi$

Volume **In Exercises 11–14, sketch the solid region whose volume is given by the iterated integral and evaluate the iterated integral.**

11. $\int_{0}^{\pi/2}\int_{0}^{3}\int_{0}^{e^{-r^2}} r\, dz\, dr\, d\theta$
12. $\int_{0}^{2\pi}\int_{0}^{2\sqrt{2}}\int_{r^2-2}^{6} r\, dz\, dr\, d\theta$
13. $\int_{0}^{2\pi}\int_{\pi/6}^{\pi/2}\int_{0}^{4} \rho^2\sin\phi\, d\rho\, d\phi\, d\theta$
14. $\int_{0}^{2\pi}\int_{0}^{\pi}\int_{2}^{5} \rho^2\sin\phi\, d\rho\, d\phi\, d\theta$

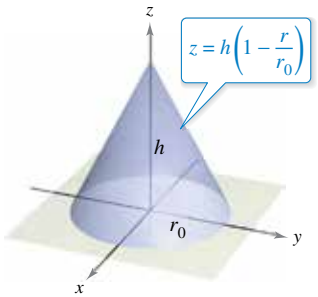
Volume **In Exercises 15–20, use cylindrical coordinates to find the volume of the solid.**

15. Solid inside both $x^2 + y^2 + z^2 = 36$ and $(x-3)^2 + y^2 = 9$
16. Solid inside $x^2 + y^2 + z^2 = 16$ and outside $z = \sqrt{x^2 + y^2}$
17. Solid bounded above by $z = 2x$ and below by $z = 2x^2 + 2y^2$
18. Solid bounded above by $z = 2 - x^2 - y^2$ and below by $z = x^2 + y^2$
19. Solid bounded by the graphs of the sphere $r^2 + z^2 = 25$ and the cylinder $r = 5\cos\theta$
20. Solid inside the sphere $x^2 + y^2 + z^2 = 4$ and above the upper nappe of the cone $z^2 = x^2 + y^2$

Mass **In Exercises 21 and 22, use cylindrical coordinates to find the mass of the solid Q of density ρ.**

21. $Q = \{(x, y, z):\ 0 \le z \le 9 - x - 2y,\ x^2 + y^2 \le 4\}$
$\rho(x, y, z) = k\sqrt{x^2 + y^2}$
22. $Q = \{(x, y, z):\ 0 \le z \le 12e^{-(x^2+y^2)},\ x^2 + y^2 \le 4,\ x \ge 0,\ y \ge 0\}$
$\rho(x, y, z) = k$

Using Cylindrical Coordinates **In Exercises 23–28, use cylindrical coordinates to find the indicated characteristic of the cone shown in the figure.**



23. Find the volume of the cone.
24. Find the centroid of the cone.
25. Find the center of mass of the cone, assuming that its density at any point is proportional to the distance between the point and the axis of the cone. Use a graphing utility to evaluate the triple integral.
26. Find the center of mass of the cone, assuming that its density at any point is proportional to the distance between the point and the base. Use a graphing utility to evaluate the triple integral.
27. Assume that the cone has uniform density and show that the moment of inertia about the z-axis is
$I_z = \frac{3}{10}mr_0^2$.
28. Assume that the density of the cone is $\rho(x, y, z) = k\sqrt{x^2 + y^2}$ and find the moment of inertia about the z-axis.

Moment of Inertia **In Exercises 29 and 30, use cylindrical coordinates to verify the given moment of inertia of the solid of uniform density.**

29. Cylindrical shell: $I_z = \frac{1}{2}m(a^2 + b^2)$
$0 < a \le r \le b,\quad 0 \le z \le h$
30. Right circular cylinder: $I_z = \frac{3}{2}ma^2$
$r = 2a\sin\theta,\quad 0 \le z \le h$
(Use a graphing utility to evaluate the triple integral.)

Volume **In Exercises 31–34, use spherical coordinates to find the volume of the solid.**

31. Solid inside

$x^2 + y^2 + z^2 = 9$

outside $z = \sqrt{x^2 + y^2}$, and above the xy-plane

32. Solid bounded above by

$x^2 + y^2 + z^2 = z$

and below by $z = \sqrt{x^2 + y^2}$

33. The torus given by $\rho = 4 \sin \phi$ (Use a graphing utility to evaluate the triple integral.)

34. The solid between the spheres

$x^2 + y^2 + z^2 = a^2$ and $x^2 + y^2 + z^2 = b^2, b > a,$

and inside the cone $z^2 = x^2 + y^2$

Mass **In Exercises 35 and 36, use spherical coordinates to find the mass of the sphere $x^2 + y^2 + z^2 = a^2$ with the given density.**

35. The density at any point is proportional to the distance between the point and the origin.

36. The density at any point is proportional to the distance between the point and the z-axis.

Center of Mass **In Exercises 37 and 38, use spherical coordinates to find the center of mass of the solid of uniform density.**

37. Hemispherical solid of radius r

38. Solid lying between two concentric hemispheres of radii r and R, where $r < R$

Moment of Inertia **In Exercises 39 and 40, use spherical coordinates to find the moment of inertia about the z-axis of the solid of uniform density.**

39. Solid bounded by the hemisphere $\rho = \cos \phi$, $\frac{\pi}{4} \le \phi \le \frac{\pi}{2}$, and the cone $\phi = \frac{\pi}{4}$

40. Solid lying between two concentric hemispheres of radii r and R, where $r < R$

Converting Coordinates **In Exercises 41–44, convert the integral from rectangular coordinates to both cylindrical and spherical coordinates, and evaluate the simplest iterated integral.**

41. $\displaystyle\int_{-2}^{2}\int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}}\int_{x^2+y^2}^{4} x \, dz \, dy \, dx$

42. $\displaystyle\int_{0}^{2}\int_{0}^{\sqrt{4-x^2}}\int_{0}^{\sqrt{16-x^2-y^2}} \sqrt{x^2 + y^2} \, dz \, dy \, dx$

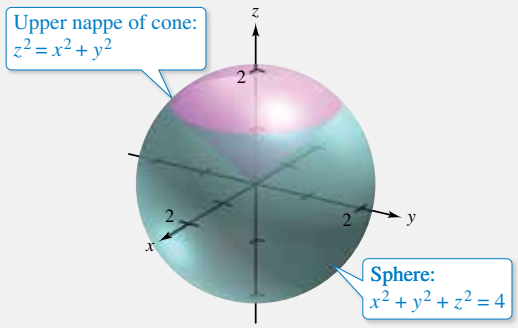
43. $\displaystyle\int_{-1}^{1}\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}}\int_{1}^{1+\sqrt{1-x^2-y^2}} x \, dz \, dy \, dx$

44. $\displaystyle\int_{0}^{3}\int_{0}^{\sqrt{9-x^2}}\int_{0}^{\sqrt{9-x^2-y^2}} \sqrt{x^2 + y^2 + z^2} \, dz \, dy \, dx$

Exploring Concepts

45. Describe the surface whose equation is a coordinate equal to a constant for each of the coordinates in (a) the cylindrical coordinate system and (b) the spherical coordinate system.

46. **HOW DO YOU SEE IT?** The solid is bounded below by the upper nappe of a cone and above by a sphere (see figure). Would it be easier to use cylindrical coordinates or spherical coordinates to find the volume of the solid? Explain.



PUTNAM EXAM CHALLENGE

47. Find the volume of the region of points (x, y, z) such that $(x^2 + y^2 + z^2 + 8)^2 \le 36(x^2 + y^2)$.

This problem was composed by the Committee on the Putnam Prize Competition.

SECTION PROJECT

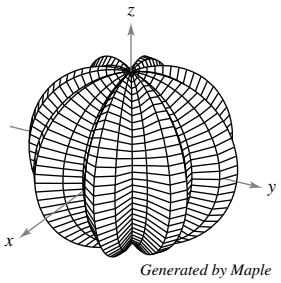
Wrinkled and Bumpy Spheres

In parts (a) and (b), find the volume of the wrinkled sphere or bumpy sphere. These solids are used as models for tumors.

(a) Wrinkled sphere

$\rho = 1 + 0.2 \sin 8\theta \sin \phi$

$0 \le \theta \le 2\pi, 0 \le \phi \le \pi$

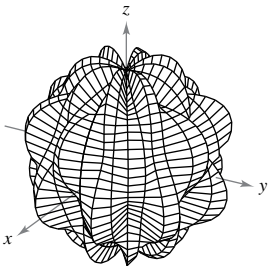


Generated by Maple

(b) Bumpy sphere

$\rho = 1 + 0.2 \sin 8\theta \sin 4\phi$

$0 \le \theta \le 2\pi, 0 \le \phi \le \pi$



Generated by Maple

FOR FURTHER INFORMATION For more information on these types of spheres, see the article "Heat Therapy for Tumors" by Leah Edelstein-Keshet in *The UMAP Journal.*

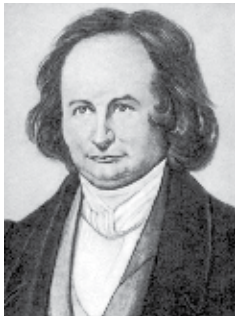
14.8 Change of Variables: Jacobians

GO DIGITAL

- **Describe the concept of a Jacobian.**
- **Use a Jacobian to change variables in a double integral.**



CARL GUSTAV JACOBI (1804–1851)

The Jacobian is named after the German mathematician Carl Gustav Jacobi. Jacobi is known for his work in many areas of mathematics, but his interest in integration stemmed from the problem of finding the circumference of an ellipse. *See LarsonCalculus.com to read more of this biography.*

Jacobians

For the single integral

$$\int_a^b f(x)\,dx$$

you can change variables by letting $x = g(u)$, so that $dx = g'(u)\,du$, and obtain

$$\int_a^b f(x)\,dx = \int_c^d f(g(u))g'(u)\,du$$

where $a = g(c)$ and $b = g(d)$. Note that the change of variables process introduces an additional factor $g'(u)$ into the integrand. This also occurs in the case of double integrals

$$\int_R\int f(x, y)\,dA = \int_S\int f(g(u, v), h(u, v))\underbrace{\left|\frac{\partial x}{\partial u}\frac{\partial y}{\partial v} - \frac{\partial y}{\partial u}\frac{\partial x}{\partial v}\right|}_{\text{Jacobian}}\,du\,dv$$

where the change of variables $x = g(u, v)$ and $y = h(u, v)$ introduces a factor called the **Jacobian** of x and y with respect to u and v. In defining the Jacobian, it is convenient to use the determinant notation shown below.

Definition of the Jacobian

If $x = g(u, v)$ and $y = h(u, v)$, then the **Jacobian** of x and y with respect to u and v, denoted by $\partial(x, y)/\partial(u, v)$, is

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial x}{\partial u}\frac{\partial y}{\partial v} - \frac{\partial y}{\partial u}\frac{\partial x}{\partial v}.$$

EXAMPLE 1 The Jacobian for Rectangular-to-Polar Conversion

Find the Jacobian for the change of variables defined by

$$x = r\cos\theta \quad \text{and} \quad y = r\sin\theta.$$

Solution From the definition of the Jacobian, you obtain

$$\begin{aligned} \frac{\partial(x, y)}{\partial(r, \theta)} &= \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} && \text{Definition of Jacobian} \\ &= \begin{vmatrix} \cos\theta & -r\sin\theta \\ \sin\theta & r\cos\theta \end{vmatrix} && \text{Substitute.} \\ &= r\cos^2\theta + r\sin^2\theta && \text{Find determinant.} \\ &= r(\cos^2\theta + \sin^2\theta) && \text{Factor.} \\ &= r. && \text{Trigonometric identity} \end{aligned}$$

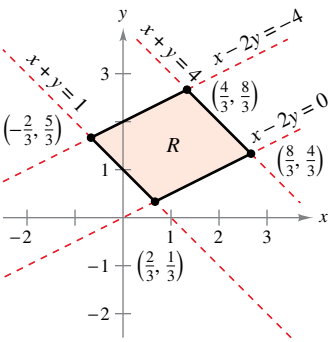
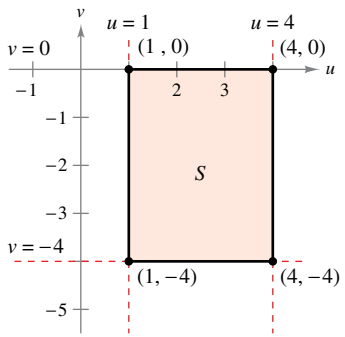
S is the region in the $r\theta$-plane that corresponds to R in the xy-plane.
Figure 14.71



Region R in the xy-plane
Figure 14.72



Region S in the uv-plane
Figure 14.73

GO DIGITAL

Example 1 points out that the change of variables from rectangular to polar coordinates for a double integral can be written as

$$\iint_R f(x, y)\, dA = \iint_S f(r\cos\theta, r\sin\theta) r\, dr\, d\theta, \; r > 0$$
$$= \iint_S f(r\cos\theta, r\sin\theta) \left|\frac{\partial(x, y)}{\partial(r, \theta)}\right| dr\, d\theta$$

where S is the region in the $r\theta$-plane that corresponds to the region R in the xy-plane, as shown in Figure 14.71. Note that this formula is similar to the one in Theorem 14.3. (See Section 14.3).

In general, a change of variables using a one-to-one **transformation** T from a region S in the uv-plane to a region R in the xy-plane is given by

$$T(u, v) = (x, y) = (g(u, v), h(u, v))$$

where g and h have continuous first partial derivatives in the region S. Note that the point (u, v) lies in S and the point (x, y) lies in R. In most cases, you are hunting for a transformation in which the region S is simpler than the region R.

EXAMPLE 2 Finding a Change of Variables to Simplify a Region

Let R be the region bounded by the lines

$$x - 2y = 0, \quad x - 2y = -4, \quad x + y = 4, \quad \text{and} \quad x + y = 1$$

as shown in Figure 14.72. Find a transformation T from a region S to R such that S is a rectangular region (with sides parallel to the u- or v-axis).

Solution To begin, let $u = x + y$ and $v = x - 2y$. Solving this system of equations for x and y produces $T(u, v) = (x, y)$, where

$$x = \frac{1}{3}(2u + v) \quad \text{and} \quad y = \frac{1}{3}(u - v).$$

The four boundaries for R in the xy-plane give rise to the following bounds for S in the uv-plane.

Bounds in the xy-Plane		**Bounds in the uv-Plane**
$x + y = 1$	⇨	$u = 1$
$x + y = 4$	⇨	$u = 4$
$x - 2y = 0$	⇨	$v = 0$
$x - 2y = -4$	⇨	$v = -4$

The region S is shown in Figure 14.73. Note that the transformation

$$T(u, v) = (x, y) = \left(\frac{1}{3}[2u + v], \frac{1}{3}[u - v]\right)$$

maps the vertices of the region S onto the vertices of the region R, as shown below.

$$T(1, 0) = \left(\frac{1}{3}[2(1) + 0], \frac{1}{3}[1 - 0]\right) = \left(\frac{2}{3}, \frac{1}{3}\right)$$
$$T(4, 0) = \left(\frac{1}{3}[2(4) + 0], \frac{1}{3}[4 - 0]\right) = \left(\frac{8}{3}, \frac{4}{3}\right)$$
$$T(4, -4) = \left(\frac{1}{3}[2(4) - 4], \frac{1}{3}[4 - (-4)]\right) = \left(\frac{4}{3}, \frac{8}{3}\right)$$
$$T(1, -4) = \left(\frac{1}{3}[2(1) - 4], \frac{1}{3}[1 - (-4)]\right) = \left(-\frac{2}{3}, \frac{5}{3}\right)$$

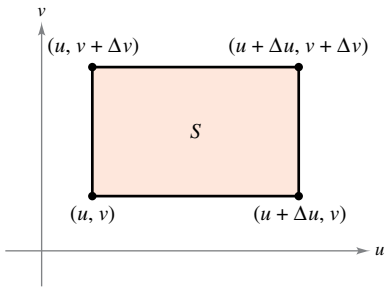
Change of Variables for Double Integrals

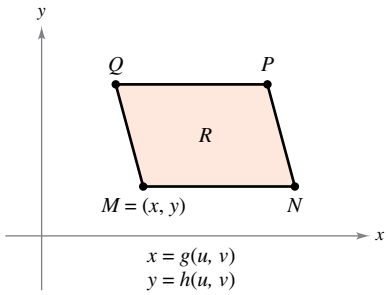
THEOREM 14.5 Change of Variables for Double Integrals

Let R be a vertically or horizontally simple region in the xy-plane, and let S be a vertically or horizontally simple region in the uv-plane. Let T from S to R be given by $T(u, v) = (x, y) = (g(u, v), h(u, v))$, where g and h have continuous first partial derivatives. Assume that T is one-to-one except possibly on the boundary of S. If f is continuous on R, and $\partial(x, y)/\partial(u, v)$ is nonzero on S, then

$$\int_R\int f(x, y)\, dx\, dy = \int_S\int f(g(u, v), h(u, v)) \left|\frac{\partial(x, y)}{\partial(u, v)}\right| du\, dv.$$



Area of $S = \Delta u\, \Delta v$
$\Delta u > 0, \Delta v > 0$
Figure 14.74



The vertices in the xy-plane are $M(g(u, v), h(u, v))$, $N(g(u + \Delta u, v), h(u + \Delta u, v))$, $P(g(u + \Delta u, v + \Delta v), h(u + \Delta u, v + \Delta v))$, and $Q(g(u, v + \Delta v), h(u, v + \Delta v))$.
Figure 14.75

Proof Consider the case in which S is a rectangular region in the uv-plane with vertices (u, v), $(u + \Delta u, v)$, $(u + \Delta u, v + \Delta v)$, and $(u, v + \Delta v)$, as shown in Figure 14.74. The images of these vertices in the xy-plane are shown in Figure 14.75. If Δu and Δv are small, then the continuity of g and h implies that R is approximately a parallelogram determined by the vectors $\overrightarrow{MN}$ and $\overrightarrow{MQ}$. So, the area of R is

$$\Delta A \approx \|\overrightarrow{MN} \times \overrightarrow{MQ}\|.$$

Moreover, for small Δu and Δv, the partial derivatives of g and h with respect to u can be approximated by

$$g_u(u, v) \approx \frac{g(u + \Delta u, v) - g(u, v)}{\Delta u} \quad \text{and} \quad h_u(u, v) \approx \frac{h(u + \Delta u, v) - h(u, v)}{\Delta u}.$$

Consequently,

$$\begin{aligned}\overrightarrow{MN} &= [g(u + \Delta u, v) - g(u, v)]\mathbf{i} + [h(u + \Delta u, v) - h(u, v)]\mathbf{j} \\ &\approx [g_u(u, v)\, \Delta u]\mathbf{i} + [h_u(u, v)\, \Delta u]\mathbf{j} \\ &= \frac{\partial x}{\partial u}\Delta u\mathbf{i} + \frac{\partial y}{\partial u}\Delta u\mathbf{j}.\end{aligned}$$

Similarly, you can approximate $\overrightarrow{MQ}$ by $\frac{\partial x}{\partial v}\Delta v\mathbf{i} + \frac{\partial y}{\partial v}\Delta v\mathbf{j}$, which implies that

$$\overrightarrow{MN} \times \overrightarrow{MQ} \approx \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial x}{\partial u}\Delta u & \frac{\partial y}{\partial u}\Delta u & 0 \\ \frac{\partial x}{\partial v}\Delta v & \frac{\partial y}{\partial v}\Delta v & 0 \end{vmatrix} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{vmatrix} \Delta u\, \Delta v\mathbf{k}.$$

It follows that, in Jacobian notation,

$$\Delta A \approx \|\overrightarrow{MN} \times \overrightarrow{MQ}\| \approx \left|\frac{\partial(x, y)}{\partial(u, v)}\right| \Delta u\, \Delta v.$$

Because this approximation improves as Δu and Δv approach 0, the limiting case can be written as

$$dA \approx \|\overrightarrow{MN} \times \overrightarrow{MQ}\| \approx \left|\frac{\partial(x, y)}{\partial(u, v)}\right| du\, dv.$$

So,

$$\int_R\int f(x, y)\, dx\, dy = \int_S\int f(g(u, v), h(u, v))\left|\frac{\partial(x, y)}{\partial(u, v)}\right| du\, dv.$$

GO DIGITAL

The next two examples show how a change of variables can simplify the integration process. The simplification can occur in various ways. You can make a change of variables to simplify either the *region R* or the *integrand* $f(x, y)$, or both.

EXAMPLE 3 Using a Change of Variables to Simplify a Region

See LarsonCalculus.com for an interactive version of this type of example.

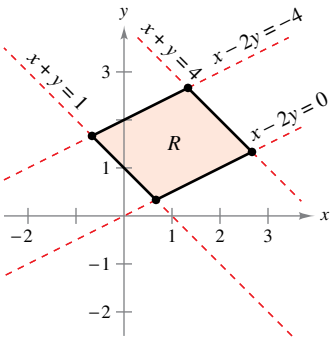

Figure 14.76

Let R be the region bounded by the lines

$$x - 2y = 0, \quad x - 2y = -4, \quad x + y = 4, \quad \text{and} \quad x + y = 1$$

as shown in Figure 14.76. Evaluate the double integral

$$\iint_R 3xy\, dA.$$

Solution From Example 2, you can use the change of variables

$$x = \frac{1}{3}(2u + v) \quad \text{and} \quad y = \frac{1}{3}(u - v).$$

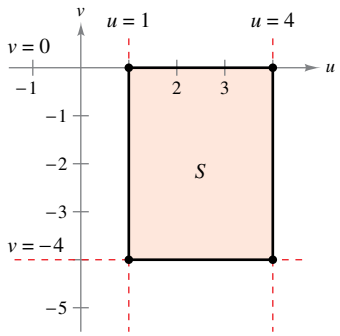

Figure 14.77

(Note that the region S is shown in Figure 14.77.) The partial derivatives of x and y are

$$\frac{\partial x}{\partial u} = \frac{2}{3}, \quad \frac{\partial x}{\partial v} = \frac{1}{3}, \quad \frac{\partial y}{\partial u} = \frac{1}{3}, \quad \text{and} \quad \frac{\partial y}{\partial v} = -\frac{1}{3}$$

which implies that the Jacobian is

$$\begin{aligned}
\frac{\partial(x, y)}{\partial(u, v)} &= \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} \\
&= \begin{vmatrix} \frac{2}{3} & \frac{1}{3} \\ \frac{1}{3} & -\frac{1}{3} \end{vmatrix} \\
&= -\frac{2}{9} - \frac{1}{9} \\
&= -\frac{1}{3}.
\end{aligned}$$

So, by Theorem 14.5, you obtain

$$\begin{aligned}
\iint_R 3xy\, dA &= \iint_S 3\left[\frac{1}{3}(2u + v)\,\frac{1}{3}(u - v)\right]\left|\frac{\partial(x, y)}{\partial(u, v)}\right| dv\, du \\
&= \int_1^4 \int_{-4}^0 \frac{1}{9}(2u^2 - uv - v^2)\, dv\, du \\
&= \frac{1}{9}\int_1^4 \left[2u^2 v - \frac{uv^2}{2} - \frac{v^3}{3}\right]_{-4}^0 du \\
&= \frac{1}{9}\int_1^4 \left(8u^2 + 8u - \frac{64}{3}\right) du \\
&= \frac{1}{9}\left[\frac{8u^3}{3} + 4u^2 - \frac{64}{3}u\right]_1^4 \\
&= \frac{164}{9}.
\end{aligned}$$

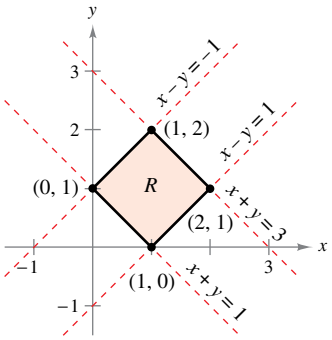
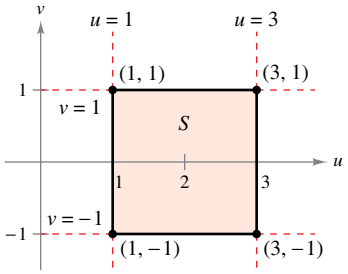
GO DIGITAL



Region R in the xy-plane
Figure 14.78



Region S in the uv-plane
Figure 14.79

EXAMPLE 4 Change of Variables: Simplifying an Integrand

Let R be the region bounded by the square with vertices $(0, 1)$, $(1, 2)$, $(2, 1)$, and $(1, 0)$. Evaluate the integral

$$\iint_R (x + y)^2 \sin^2(x - y)\, dA.$$

Solution Note that the sides of R lie on the lines $x + y = 1$, $x - y = 1$, $x + y = 3$, and $x - y = -1$, as shown in Figure 14.78. Letting $u = x + y$ and $v = x - y$, you can determine the bounds for region S in the uv-plane to be

$$1 \le u \le 3 \quad \text{and} \quad -1 \le v \le 1$$

as shown in Figure 14.79. Solving for x and y in terms of u and v produces

$$x = \frac{1}{2}(u + v) \quad \text{and} \quad y = \frac{1}{2}(u - v).$$

The partial derivatives of x and y are

$$\frac{\partial x}{\partial u} = \frac{1}{2}, \quad \frac{\partial x}{\partial v} = \frac{1}{2}, \quad \frac{\partial y}{\partial u} = \frac{1}{2}, \quad \text{and} \quad \frac{\partial y}{\partial v} = -\frac{1}{2}$$

which implies that the Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & -\frac{1}{2} \end{vmatrix} = -\frac{1}{4} - \frac{1}{4} = -\frac{1}{2}.$$

By Theorem 14.5, it follows that

$$\begin{aligned}
\iint_R (x + y)^2 \sin^2(x - y)\, dA &= \int_{-1}^{1}\int_{1}^{3} u^2(\sin^2 v)\left(\frac{1}{2}\right) du\, dv \\
&= \frac{1}{2}\int_{-1}^{1} (\sin^2 v)\, \frac{u^3}{3}\Big]_1^3 dv \\
&= \frac{13}{3}\int_{-1}^{1} \sin^2 v\, dv \\
&= \frac{13}{6}\int_{-1}^{1} (1 - \cos 2v)\, dv \\
&= \frac{13}{6}\left[v - \frac{1}{2}\sin 2v\right]_{-1}^{1} \\
&= \frac{13}{6}\left[2 - \frac{1}{2}\sin 2 + \frac{1}{2}\sin(-2)\right] \\
&= \frac{13}{6}(2 - \sin 2) \\
&\approx 2.363.
\end{aligned}$$

In each of the change of variables examples in this section, the region S has been a rectangle with sides parallel to the u- or v-axis. Occasionally, a change of variables can be used for other types of regions. For instance, letting $T(u, v) = \left(x, \frac{1}{2}y\right)$ changes the circular region $u^2 + v^2 = 1$ to the elliptical region

$$x^2 + \frac{y^2}{4} = 1.$$

14.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

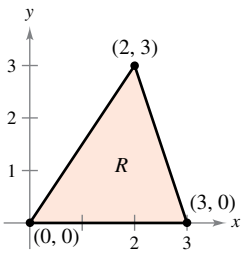
1. Describe how to find the Jacobian of x and y with respect to u and v for $x = g(u, v)$ and $y = h(u, v)$.
2. Explain when it is beneficial to use the Jacobian to change variables in a double integral.

Finding a Jacobian **In Exercises 3–10, find the Jacobian $\partial(x, y)/\partial(u, v)$ for the indicated change of variables.**

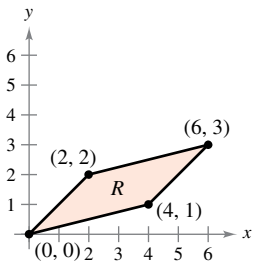
3. $x = -\frac{1}{2}(u - v),\ y = \frac{1}{2}(u + v)$
4. $x = 5u - v,\ y = 3u + 4v$
5. $x = u - v^2,\ y = u + v$
6. $x = uv - 2u,\ y = uv$
7. $x = u\cos\theta - v\sin\theta,\ y = u\sin\theta + v\cos\theta$
8. $x = u + 1,\ y = 9v$
9. $x = e^u \sin v,\ y = e^u \cos v$
10. $x = u/v,\ y = u + v$

Using a Transformation **In Exercises 11–14, sketch the image S in the uv-plane of the region R in the xy-plane using the given transformations.**

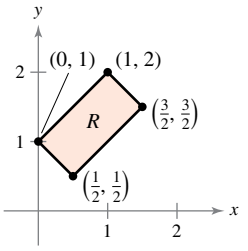
11. $x = 3u + 2v$, $y = 3v$



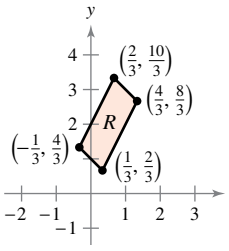
12. $x = \frac{1}{3}(4u - v)$, $y = \frac{1}{3}(u - v)$



13. $x = \frac{1}{2}(u + v)$, $y = \frac{1}{2}(u - v)$



14. $x = \frac{1}{3}(v - u)$, $y = \frac{1}{3}(2v + u)$



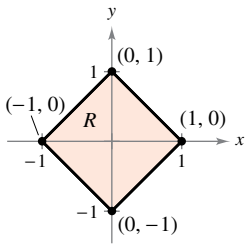
Verifying a Change of Variables **In Exercises 15 and 16, verify the result of the indicated example by setting up the integral using $dy\,dx$ or $dx\,dy$ for dA. Then use a graphing utility to evaluate the integral.**

15. Example 3

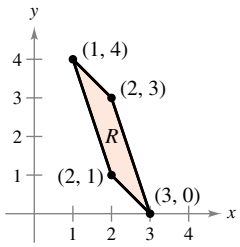
16. Example 4

Evaluating a Double Integral Using a Change of Variables **In Exercises 17–22, use the indicated change of variables to evaluate the double integral.**

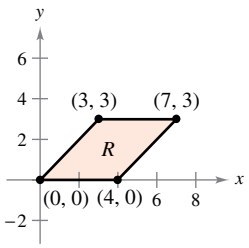
17. $\iint_R 4(x^2 + y^2)\,dA$
$x = \frac{1}{2}(u + v)$
$y = \frac{1}{2}(u - v)$



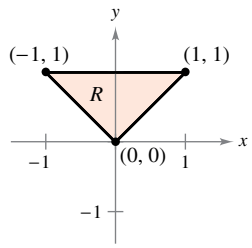
18. $\iint_R (2y - x)\,dA$
$x = \frac{1}{2}(v - u)$
$y = \frac{1}{2}(3u - v)$



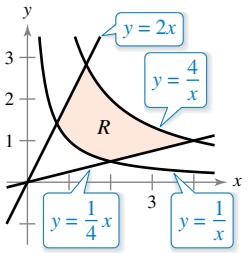
19. $\iint_R y(x - y)\,dA$
$x = u + v$
$y = u$



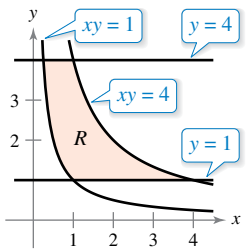
20. $\iint_R 4(x + y)e^{x-y}\,dA$
$x = \frac{1}{2}(u + v)$
$y = \frac{1}{2}(u - v)$



21. $\iint_R e^{-xy/2}\,dA$
$x = \sqrt{\frac{v}{u}},\quad y = \sqrt{uv}$



22. $\iint_R y\sin xy\,dA$
$x = \frac{u}{v},\quad y = v$



Finding Volume Using a Change of Variables **In Exercises 23–30, use a change of variables to find the volume of the solid region lying below the surface $z = f(x, y)$ and above the plane region R.**

23. $f(x, y) = 9xy$

R: region bounded by the square with vertices $(1, 0)$, $(0, 1)$, $(1, 2)$, $(2, 1)$

24. $f(x, y) = (3x + 2y)^2\sqrt{2y - x}$

R: region bounded by the parallelogram with vertices $(0, 0)$, $(-2, 3)$, $(2, 5)$, $(4, 2)$

25. $f(x, y) = (x + y)e^{x-y}$

R: region bounded by the square with vertices $(4, 0)$, $(6, 2)$, $(4, 4)$, $(2, 2)$

26. $f(x, y) = (x + y)^2 \sin^2(x - y)$

R: region bounded by the square with vertices $(\pi, 0)$, $(3\pi/2, \pi/2)$, (π, π), $(\pi/2, \pi/2)$

27. $f(x, y) = \sqrt{(x - y)(x + 4y)}$

R: region bounded by the parallelogram with vertices $(0, 0)$, $(1, 1)$, $(5, 0)$, $(4, -1)$

28. $f(x, y) = (3x + 2y)(2y - x)^{3/2}$

R: region bounded by the parallelogram with vertices $(0, 0)$, $(-2, 3)$, $(2, 5)$, $(4, 2)$

29. $f(x, y) = \sqrt{x + y}$

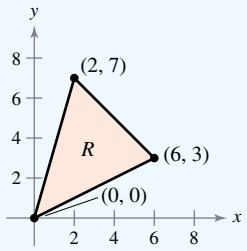
R: region bounded by the triangle with vertices $(0, 0)$, $(a, 0)$, $(0, a)$, where $a > 0$

30. $f(x, y) = \dfrac{xy}{1 + x^2y^2}$

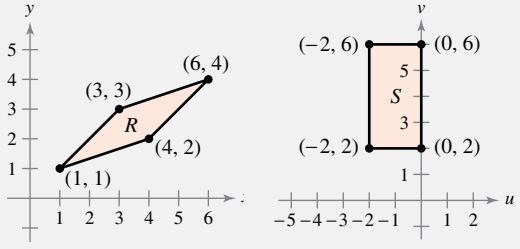
R: region bounded by the graphs of $xy = 1$, $xy = 4$, $x = 1$, $x = 4$ (*Hint:* Let $x = u$, $y = v/u$.)

Exploring Concepts

31. The substitutions $u = 2x - y$ and $v = x + y$ make the region R (see figure) into a simpler region S in the uv-plane. Determine the total number of sides of S that are parallel to either the u-axis or the v-axis.



32. HOW DO YOU SEE IT? The region R is transformed into a simpler region S (see figure). Which substitution can be used to make the transformation?



(a) $u = 3y - x$, $v = y - x$ (b) $u = y - x$, $v = 3y - x$

33. Using an Ellipse Consider the region R in the xy-plane bounded by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

and the transformations $x = au$ and $y = bv$.

(a) Sketch the graph of the region R and its image S under the given transformation.

(b) Find $\dfrac{\partial(x, y)}{\partial(u, v)}$.

(c) Find the area of the ellipse using the indicated change of variables.

34. Volume Use the result of Exercise 33 to find the volume of each dome-shaped solid lying below the surface $z = f(x, y)$ and above the elliptical region R. (*Hint:* After making the change of variables given by the results in Exercise 33, make a second change of variables to polar coordinates.)

(a) $f(x, y) = 16 - x^2 - y^2$; R: $\dfrac{x^2}{16} + \dfrac{y^2}{9} \le 1$

(b) $f(x, y) = A\cos\left(\dfrac{\pi}{2}\sqrt{\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2}}\right)$; R: $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} \le 1$

Finding a Jacobian **In Exercises 35–40, find the Jacobian**

$$\frac{\partial(x, y, z)}{\partial(u, v, w)}$$

for the indicated change of variables. If

$$x = f(u, v, w), \quad y = g(u, v, w), \quad \text{and} \quad z = h(u, v, w)$$

then the Jacobian of x, y, and z with respect to u, v, and w is

$$\frac{\partial(x, y, z)}{\partial(u, v, w)} = \begin{vmatrix} \dfrac{\partial x}{\partial u} & \dfrac{\partial x}{\partial v} & \dfrac{\partial x}{\partial w} \\ \dfrac{\partial y}{\partial u} & \dfrac{\partial y}{\partial v} & \dfrac{\partial y}{\partial w} \\ \dfrac{\partial z}{\partial u} & \dfrac{\partial z}{\partial v} & \dfrac{\partial z}{\partial w} \end{vmatrix}.$$

35. $x = u(1 - v)$, $y = uv(1 - w)$, $z = uvw$

36. $x = 4u - v$, $y = 4v - w$, $z = u + w$

37. $x = \frac{1}{2}(u + v)$, $y = \frac{1}{2}(u - v)$, $z = 2uvw$

38. $x = u - v + w$, $y = 2uv$, $z = u + v + w$

39. Spherical coordinates

$x = \rho \sin\phi \cos\theta$, $y = \rho \sin\phi \sin\theta$, $z = \rho \cos\phi$

40. Cylindrical coordinates

$x = r \cos\theta$, $y = r \sin\theta$, $z = z$

PUTNAM EXAM CHALLENGE

41. Let A be the area of the region in the first quadrant bounded by the line $y = \frac{1}{2}x$, the x-axis, and the ellipse $\frac{1}{9}x^2 + y^2 = 1$. Find the positive number m such that A is equal to the area of the region in the first quadrant bounded by the line $y = mx$, the y-axis, and the ellipse $\frac{1}{9}x^2 + y^2 = 1$.

This problem was composed by the Committee on the Putnam Prize Competition.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In this chapter, you combined your knowledge of integration and functions of several variables to develop double and triple integrals. You are now able to integrate functions over many geometrical objects, from intervals on the x-axis to regions in the plane to complicated three-dimensional solids. You looked at a number of important applications, including volume, centers of mass, and surface area. You saw that many double integrals are easier to evaluate using polar coordinates. Similarly, many triple integrals are better analyzed using cylindrical or spherical coordinates.

1. Explain how to change from rectangular coordinates to polar coordinates in a double integral.

2. Identify the expression that is invalid. Explain your reasoning.

(a) $\int_0^2 \int_0^3 f(x, y)\, dy\, dx$ (b) $\int_0^2 \int_0^y f(x, y)\, dy\, dx$

(c) $\int_0^2 \int_x^3 f(x, y)\, dy\, dx$ (d) $\int_0^2 \int_0^x f(x, y)\, dy\, dx$

3. Give a geometric argument for the equality. Verify the equality analytically.

$$\int_0^2 \int_{3y/2}^{5-y} e^{x+y}\, dx\, dy = \int_0^3 \int_0^{2x/3} e^{x+y}\, dy\, dx + \int_3^5 \int_0^{5-x} e^{x+y}\, dy\, dx$$

4. Answer each question about the surface area S on a surface given by a positive function $z = f(x, y)$ that lies above a region R in the xy-plane. Explain each answer.

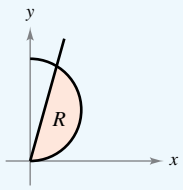
(a) Is it possible for S to equal the area of R?

(b) Can S be greater than the area of R?

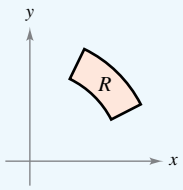
(c) Can S be less than the area of R?

5. Each figure shows a region of integration for the double integral $\int_R \int f(x, y)\, dA$. For each region, state whether horizontal representative elements, vertical representative elements, or polar sectors would yield the easiest method for obtaining the limits of integration. Explain your reasoning.

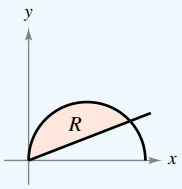
(a)



(b)



(c)



6. Convert the integral from rectangular coordinates to both (a) cylindrical and (b) spherical coordinates. Without evaluating, which integral appears to be the simplest to evaluate? Why?

$$\int_0^a \int_0^{\sqrt{a^2-x^2}} \int_0^{\sqrt{a^2-x^2-y^2}} \sqrt{x^2 + y^2 + z^2}\, dz\, dy\, dx$$

Evaluating an Integral

In Exercises 7–10, evaluate the integral.

7. $\int_0^{3x} \sin xy\, dy$

8. $\int_y^{y^2} \frac{x}{y + 1}\, dx$

9. $\int_y^{2y} (x^2 + y^2)\, dx$

10. $\int_1^{x^2} x \ln y\, dy$

Evaluating an Iterated Integral

In Exercises 11–14, evaluate the iterated integral.

11. $\int_0^1 \int_0^{1+x} (3x + 2y)\, dy\, dx$

12. $\int_0^2 \int_{x^2}^{2x} (x^2 + 2y)\, dy\, dx$

13. $\int_0^1 \int_0^{\sqrt{1-x^4}} x^3\, dy\, dx$

14. $\int_0^1 \int_0^{2y} (9 + 3x^2 + 3y^2)\, dx\, dy$

Finding the Area of a Region

In Exercises 15–18, use an iterated integral to find the area of the region bounded by the graphs of the equations.

15. $x + 3y = 3,\ x = 0,\ y = 0$

16. $y = 6x - x^2,\ y = x^2 - 2x$

17. $y = x,\ y = 2x + 2,\ x = 0,\ x = 4$

18. $x = y^2 + 1,\ x = 0,\ y = 0,\ y = 2$

Changing the Order of Integration

In Exercises 19–22, sketch the region R whose area is given by the iterated integral. Then change the order of integration and show that both orders yield the same area.

19. $\int_1^5 \int_0^4 dy\, dx$

20. $\int_{-3}^3 \int_0^{9-y^2} dx\, dy$

21. $\int_0^2 \int_{y/2}^{3-y} dx\, dy$

22. $\int_0^3 \int_0^x dy\, dx + \int_3^6 \int_0^{6-x} dy\, dx$

Evaluating a Double Integral **In Exercises 23 and 24, set up integrals for both orders of integration. Use the more convenient order to evaluate the integral over the plane region R.**

23. $\iint_R 4xy\,dA$

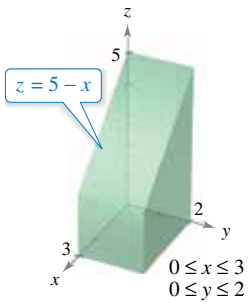
R: rectangle with vertices $(0, 0)$, $(0, 4)$, $(2, 4)$, $(2, 0)$

24. $\iint_R 6x^2\,dA$

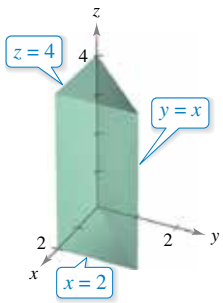
R: region bounded by $y = 0$, $y = \sqrt{x}$, $x = 1$

Finding Volume **In Exercises 25–28, use a double integral to find the volume of the indicated solid.**

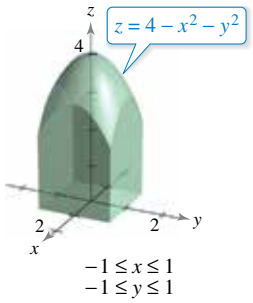
25.



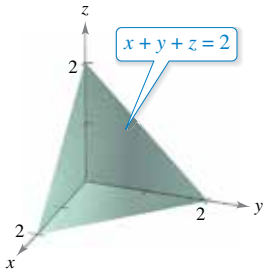
26.



27.



28.



Average Value **In Exercises 29 and 30, find the average value of $f(x, y)$ over the plane region R.**

29. $f(x) = 16 - x^2 - y^2$

R: rectangle with vertices $(2, 2)$, $(-2, 2)$, $(-2, -2)$, $(2, -2)$

30. $f(x) = 2x^2 + y^2$

R: square with vertices $(0, 0)$, $(3, 0)$, $(3, 3)$, $(0, 3)$

31. Average Temperature The temperature in degrees Celsius on the surface of a metal plate is

$$T(x, y) = 40 - 6x^2 - y^2$$

where x and y are measured in centimeters. Estimate the average temperature when x varies between 0 and 3 centimeters and y varies between 0 and 5 centimeters.

32. Average Profit A firm's profit P (in dollars) from marketing two television models is

$$P = 192x + 576y - x^2 - 5y^2 - 2xy - 5000$$

where x and y represent the numbers of units of the two television models. Estimate the average weekly profit when x varies between 40 and 50 units and y varies between 45 and 60 units.

Converting to Polar Coordinates **In Exercises 33 and 34, evaluate the iterated integral by converting to polar coordinates.**

33. $\int_0^{\sqrt{5}} \int_0^{\sqrt{5-x^2}} \sqrt{x^2 + y^2}\,dy\,dx$

34. $\int_0^4 \int_0^{\sqrt{16-y^2}} (x^2 + y^2)\,dx\,dy$

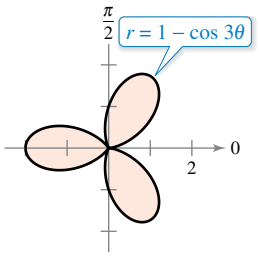
Volume **In Exercises 35 and 36, use a double integral in polar coordinates to find the volume of the solid bounded by the graphs of the equations.**

35. $z = xy^2$, $x^2 + y^2 = 9$, first octant

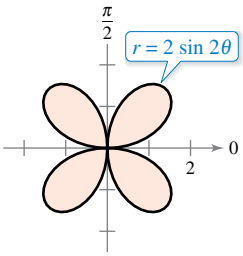
36. $z = \sqrt{25 - x^2 - y^2}$, $z = 0$, $x^2 + y^2 = 16$

Area **In Exercises 37 and 38, use a double integral to find the area of the shaded region.**

37.



38.



Area **In Exercises 39 and 40, sketch a graph of the region bounded by the graphs of the equations. Then use a double integral to find the area of the region.**

39. Inside the limaçon $r = 3 + 2\cos\theta$ and outside the circle $r = 4$

40. Inside the circle $r = 3\sin\theta$ and outside the cardioid $r = 1 + \sin\theta$

41. Area and Volume Consider the region R in the xy-plane bounded by $(x^2 + y^2)^2 = 9(x^2 - y^2)$.

(a) Convert the equation to polar coordinates. Use a graphing utility to graph the equation.

(b) Use a double integral to find the area of the region R.

(c) Use a graphing utility to find the volume of the solid region bounded above by the hemisphere

$$z = \sqrt{9 - x^2 - y^2}$$

and below by the region R.

42. Converting to Polar Coordinates Write the sum of the two iterated integrals as a single iterated integral by converting to polar coordinates. Evaluate the resulting iterated integral.

$$\int_0^{8/\sqrt{13}} \int_0^{3x/2} xy\,dy\,dx + \int_{8/\sqrt{13}}^4 \int_0^{\sqrt{16-x^2}} xy\,dy\,dx$$

Finding the Mass of a Lamina **In Exercises 43 and 44, find the mass of the lamina described by the inequalities, given that its density is $\rho(x, y) = x + 3y$.**

43. $0 \le x \le 1$, $0 \le y \le 2$

44. $x \ge 0$, $0 \le y \le \sqrt{4 - x^2}$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Finding the Center of Mass **In Exercises 45–48, find the mass and center of mass of the lamina bounded by the graphs of the equations for the given density.**

45. $y = x^3,\ y = 0,\ x = 2,\ \rho = kx$

46. $y = \dfrac{2}{x},\ y = 0,\ x = 1,\ x = 2,\ \rho = ky$

47. $y = 2x,\ y = 2x^3,\ x \geq 0,\ y \geq 0,\ \rho = kxy$

48. $y = 6 - x,\ y = 0,\ x = 0,\ \rho = kx^2$

Finding Moments of Inertia and Radii of Gyration **In Exercises 49 and 50, find $I_x, I_y, I_0, \bar{\bar{x}}$, and $\bar{\bar{y}}$ for the lamina bounded by the graphs of the equations.**

49. $y = 0,\ y = 2,\ x = 0,\ x = 3,\ \rho = kx$

50. $y = 4 - x^2,\ y = 0,\ x > 0,\ \rho = ky$

Finding Surface Area **In Exercises 51–54, find the area of the surface given by $z = f(x, y)$ that lies above the region R.**

51. $f(x, y) = 25 - x^2 - y^2$

$R = \{(x, y):\ x^2 + y^2 \leq 25\}$

52. $f(x, y) = 8 + 4x - 5y$

$R = \{(x, y):\ x^2 + y^2 \leq 1\}$

53. $f(x, y) = 9 - y^2$

R: triangle with vertices $(-3, 3)$, $(0, 0)$, $(3, 3)$

54. $f(x, y) = 4 - x^2$

R: triangle with vertices $(-2, 2)$, $(0, 0)$, $(2, 2)$

55. Building Design A new auditorium is built with a foundation in the shape of one-fourth of a circle of radius 50 feet. So, it forms a region R bounded by the graph of $x^2 + y^2 = 50^2$ with $x \geq 0$ and $y \geq 0$. The following equations are models for the floor and ceiling.

$$\text{Floor: } z = \frac{x + y}{5} \qquad \text{Ceiling: } z = 20 + \frac{xy}{100}$$

(a) Calculate the volume of the room, which is needed to determine the heating and cooling requirements.

(b) Find the surface area of the ceiling.

56. Surface Area The roof over the stage of an open-air theater at a theme park is modeled by

$$f(x, y) = 25\left[1 + e^{-(x^2+y^2)/1000}\cos^2\left(\frac{x^2 + y^2}{1000}\right)\right]$$

where the stage is a semicircle bounded by the graphs of $y = \sqrt{50^2 - x^2}$ and $y = 0$.

(a) Use a graphing utility to graph the surface.

(b) Use a graphing utility to approximate the number of square feet of roofing required to cover the surface.

Evaluating a Triple Iterated Integral **In Exercises 57–60, evaluate the triple iterated integral.**

57. $\displaystyle\int_0^4 \int_0^1 \int_0^2 (2x + y + 4z)\, dy\, dz\, dx$

58. $\displaystyle\int_0^1 \int_0^{1+\sqrt{y}} \int_0^{xy} y\, dz\, dx\, dy$

59. $\displaystyle\int_0^2 \int_1^2 \int_0^1 (e^x + y^2 + z^2)\, dx\, dy\, dz$

60. $\displaystyle\int_0^3 \int_{\pi/2}^{\pi} \int_2^5 z \sin x\, dy\, dx\, dz$

Evaluating a Triple Iterated Integral Using Technology **In Exercises 61 and 62, use a graphing utility to evaluate the triple iterated integral.**

61. $\displaystyle\int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_{-\sqrt{1-x^2-y^2}}^{\sqrt{1-x^2-y^2}} (x^2 + y^2)\, dz\, dy\, dx$

62. $\displaystyle\int_0^2 \int_0^{\sqrt{4-x^2}} \int_0^{\sqrt{4-x^2-y^2}} xyz\, dz\, dy\, dx$

Volume **In Exercises 63 and 64, use a triple integral to find the volume of the solid bounded by the graphs of the equations.**

63. $z = xy,\ z = 0,\ 0 \leq x \leq 3,\ 0 \leq y \leq 4$

64. $z = 8 - x - y,\ z = 0,\ y = x,\ y = 3,\ x = 0$

Changing the Order of Integration **In Exercises 65 and 66, sketch the solid whose volume is given by the iterated integral. Then rewrite the integral using the indicated order of integration.**

65. $\displaystyle\int_0^1 \int_0^y \int_0^{\sqrt{1-x^2}} dz\, dx\, dy$

Rewrite using the order $dz\, dy\, dx$.

66. $\displaystyle\int_0^6 \int_0^{6-x} \int_0^{6-x-y} dz\, dy\, dx$

Rewrite using the order $dy\, dx\, dz$.

Center of Mass **In Exercises 67 and 68, find the mass and the indicated coordinate of the center of mass of the solid region Q of density ρ bounded by the graphs of the equations.**

67. Find $\bar{x}$ using $\rho(x, y, z) = k$.

$Q:\ x + y + z = 10,\ x = 0,\ y = 0,\ z = 0$

68. Find $\bar{y}$ using $\rho(x, y, z) = kx$.

$Q:\ z = 5 - y,\ z = 0,\ y = 0,\ x = 0,\ x = 5$

Evaluating a Triple Iterated Integral **In Exercises 69–72, evaluate the triple iterated integral.**

69. $\displaystyle\int_0^3 \int_{\pi/6}^{\pi/3} \int_0^4 r \cos\theta\, dr\, d\theta\, dz$

70. $\displaystyle\int_0^{\pi/2} \int_0^3 \int_0^{4-z} z\, dr\, dz\, d\theta$

71. $\displaystyle\int_0^{\pi} \int_0^{\pi/2} \int_0^{\sin\theta} \rho^2 \sin\theta \cos\theta\, d\rho\, d\theta\, d\phi$

72. $\displaystyle\int_0^{\pi/4} \int_0^{\pi/4} \int_0^{\cos\phi} \cos\theta\, d\rho\, d\phi\, d\theta$

Evaluating a Triple Iterated Integral Using Technology **In Exercises 73 and 74, use a graphing utility to evaluate the triple iterated integral.**

73. $\int_0^{\pi}\int_0^{2}\int_0^{3}\sqrt{z^2+4}\,dz\,dr\,d\theta$

74. $\int_0^{\pi/2}\int_0^{\pi/2}\int_0^{\cos\phi}\rho^2\cos\theta\,d\rho\,d\theta\,d\phi$

Volume **In Exercises 75 and 76, use cylindrical coordinates to find the volume of the solid.**

75. Solid bounded above by $z = 8 - x^2 - y^2$ and below by $z = x^2 + y^2$

76. Solid bounded above by $3x^2 + 3y^2 + z^2 = 45$ and below by the xy-plane

Volume **In Exercises 77 and 78, use spherical coordinates to find the volume of the solid.**

77. Solid bounded above by $x^2 + y^2 + z^2 = 4$ and below by $z^2 = 3x^2 + 3y^2$

78. Solid bounded above by $x^2 + y^2 + z^2 = 36$ and below by $z = \sqrt{x^2 + y^2}$

Finding a Jacobian **In Exercises 79–82, find the Jacobian**

$$\frac{\partial(x, y)}{\partial(u, v)}$$

for the indicated change of variables.

79. $x = 3uv,\ y = 2(u - v)$

80. $x = u^2 + v^2,\ y = u^2 - v^2$

81. $x = u\sin\theta + v\cos\theta,\ y = u\cos\theta + v\sin\theta$

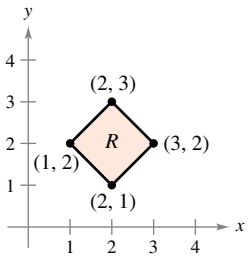
82. $x = uv,\ y = \dfrac{v}{u}$

Evaluating a Double Integral Using a Change of Variables **In Exercises 83–86, use the indicated change of variables to evaluate the double integral.**

83. $\iint_R \ln(x + y)\,dA$

$x = \frac{1}{2}(u + v)$

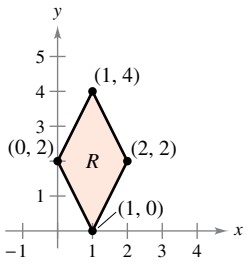
$y = \frac{1}{2}(u - v)$



84. $\iint_R 16xy\,dA$

$x = \frac{1}{4}(u + v)$

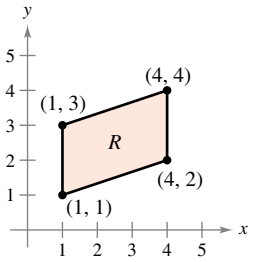
$y = \frac{1}{2}(v - u)$



85. $\iint_R (xy + x^2)\,dA$

$x = u$

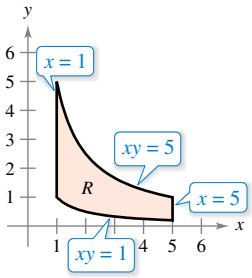
$y = \frac{1}{3}(u - v)$



86. $\iint_R \dfrac{x}{1 + x^2y^2}\,dA$

$x = u$

$y = \dfrac{v}{u}$



Building on Concepts

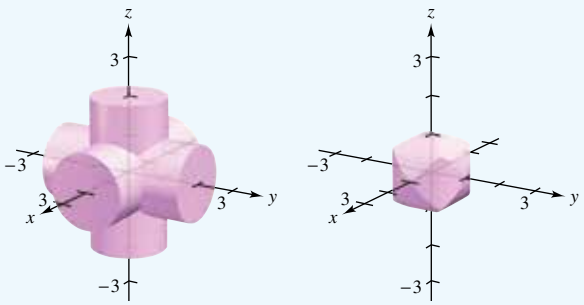
87. Show that

$$\sum_{n=1}^{\infty}\frac{1}{n^3} = \int_0^1\int_0^1\int_0^1\frac{1}{1 - xyz}\,dx\,dy\,dz.$$

88. Find the volume of the solid of intersection of the three cylinders

$x^2 + z^2 = 1,\quad y^2 + z^2 = 1,\quad$ and $\quad x^2 + y^2 = 1$

as shown in the figure.



89. Consider a spherical segment of height h from a sphere of radius a, where $h \le a$, and constant density $\rho(x, y, z) = k$, as shown in the figure.

(a) Find the volume of the solid.

(b) Find the centroid of the solid.

(c) Use the result of part (b) to find the centroid of a hemisphere of radius a.

(d) Find $\lim_{h\to 0}\bar{z}$.

(e) Find I_z.

(f) Use the result of part (e) to find I_z for a hemisphere.

P.S. Problem Solving

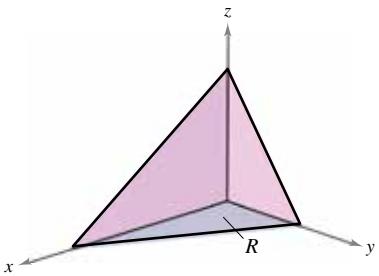
See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Surface Area Let a, b, c, and d be positive real numbers. The portion of the plane $ax + by + cz = d$ in the first octant is shown in the figure. Show that the surface area of this portion of the plane is equal to

$$\frac{A(R)}{c}\sqrt{a^2 + b^2 + c^2}$$

where $A(R)$ is the area of the triangular region R in the xy-plane, as shown in the figure.



2. Sprinkler Consider a circular lawn with a radius of 10 feet, as shown in the figure. Assume that a sprinkler distributes water in a radial fashion according to the formula

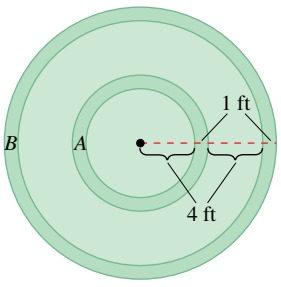
$$f(r) = \frac{r}{16} - \frac{r^2}{160}$$

(measured in cubic feet of water per hour per square foot of lawn), where r is the distance in feet from the sprinkler. Find the amount of water that is distributed in 1 hour in the following two annular regions.

$A = \{(r, \theta): 4 \le r \le 5, 0 \le \theta \le 2\pi\}$

$B = \{(r, \theta): 9 \le r \le 10, 0 \le \theta \le 2\pi\}$

Is the distribution of water uniform? Determine the amount of water the entire lawn receives in 1 hour.



3. Volume Find the volume of the solid generated by revolving the region in the first quadrant bounded by $y = e^{-x^2}$ about the y-axis. Use this result to find

$$\int_{-\infty}^{\infty} e^{-x^2}\,dx.$$

4. Proof Prove that $\lim_{n\to\infty} \int_0^1 \int_0^1 x^n y^n\,dx\,dy = 0$.

5. Deriving a Sum Derive Euler's famous result that was mentioned in Section 9.3,

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \frac{\pi^2}{6}$$

by completing each step.

(a) Prove that

$$\int \frac{dv}{2 - u^2 + v^2} = \frac{1}{\sqrt{2 - u^2}} \arctan \frac{v}{\sqrt{2 - u^2}} + C.$$

(b) Prove that $I_1 = \int_0^{\sqrt{2}/2} \int_{-u}^{u} \frac{2}{2 - u^2 + v^2}\,dv\,du = \frac{\pi^2}{18}$ by using the substitution $u = \sqrt{2}\sin\theta$.

(c) Prove that

$$I_2 = \int_{\sqrt{2}/2}^{\sqrt{2}} \int_{u-\sqrt{2}}^{-u+\sqrt{2}} \frac{2}{2 - u^2 + v^2}\,dv\,du$$
$$= 4\int_{\pi/6}^{\pi/2} \arctan \frac{1 - \sin\theta}{\cos\theta}\,d\theta$$

by using the substitution $u = \sqrt{2}\sin\theta$.

(d) Prove the trigonometric identity

$$\frac{1 - \sin\theta}{\cos\theta} = \tan\left[\frac{(\pi/2) - \theta}{2}\right].$$

(e) Prove that $I_2 = \int_{\sqrt{2}/2}^{\sqrt{2}} \int_{u-\sqrt{2}}^{-u+\sqrt{2}} \frac{2}{2 - u^2 + v^2}\,dv\,du = \frac{\pi^2}{9}$.

(f) Use the formula for the sum of an infinite geometric series to verify that

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \int_0^1 \int_0^1 \frac{1}{1 - xy}\,dx\,dy.$$

(g) Use the change of variables

$$u = \frac{x + y}{\sqrt{2}} \quad \text{and} \quad v = \frac{y - x}{\sqrt{2}}$$

to prove that

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = \int_0^1 \int_0^1 \frac{1}{1 - xy}\,dx\,dy = I_1 + I_2 = \frac{\pi^2}{6}.$$

6. Volume Show that the volume of a spherical block can be approximated by

$$\Delta V \approx \rho^2 \sin\phi\,\Delta\rho\,\Delta\phi\,\Delta\theta.$$

(*Hint:* See Section 14.7, page 1027.)

7. Changing the Order of Integration Sketch the solid whose volume is given by the sum of the iterated integrals

$$\int_0^6 \int_{z/2}^3 \int_{z/2}^{y} dx\,dy\,dz + \int_0^6 \int_3^{(12-z)/2} \int_{z/2}^{6-y} dx\,dy\,dz.$$

Then write the volume as a single iterated integral in the order $dy\,dz\,dx$ and find the volume of the solid.

15.1 Vector Fields

GO DIGITAL

- Describe the concept of a vector field.
- Determine whether a vector field is conservative.
- Find the curl of a vector field.
- Find the divergence of a vector field.

Big Ideas of Calculus

You have studied a wide variety of functions, including

- functions of a single variable $y = f(x)$,
- functions of two variables $z = f(x, y)$, and
- vector-valued functions $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$.

You will now study *vector fields*. Vector fields are functions which assign vectors to points in the plane (or in space). Examples of vector fields are velocity fields, electromagnetic fields, and gravitational fields. To analyze these applications, you will combine your knowledge of vectors with your knowledge of integral calculus. The integration in Sections 15.1 through 15.4 is done over a plane region bounded by curves, whereas in Sections 15.5 through 15.8, the integration is done over regions in space bounded by surfaces.

Vector Fields

In Chapter 12, you studied vector-valued functions—functions that assign a vector to a *real number*. There you learned that vector-valued functions of real numbers are useful in representing curves and motion along a curve. In this chapter, you will study two other types of vector-valued functions—functions that assign a vector to a *point in the plane* or a *point in space*. Such functions are called **vector fields,** and they are useful in representing various types of **force fields** and **velocity fields.**

Definition of Vector Field

A **vector field over a plane region R** is a function $\mathbf{F}$ that assigns a vector $\mathbf{F}(x, y)$ to each point in R.

A **vector field over a solid region Q in space** is a function $\mathbf{F}$ that assigns a vector $\mathbf{F}(x, y, z)$ to each point in Q.

Although a vector field consists of infinitely many vectors, you can get a good idea of what the vector field looks like by sketching several representative vectors $\mathbf{F}(x, y)$ whose initial points are (x, y).

The *gradient* is one example of a vector field. For instance, if

$$f(x, y) = x^2y + 3xy^3 \qquad \text{Function of two variables}$$

then the gradient of f

$$\begin{aligned}\nabla f(x, y) &= f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} \\ &= (2xy + 3y^3)\mathbf{i} + (x^2 + 9xy^2)\mathbf{j} \qquad \text{Vector field in the plane}\end{aligned}$$

is a vector field in the plane. From Chapter 13, the graphical interpretation of this field is a family of vectors, each of which points in the direction of maximum increase along the surface given by $z = f(x, y)$.

Similarly, if

$$f(x, y, z) = x^2 + y^2 + z^2 \qquad \text{Function of three variables}$$

then the gradient of f

$$\begin{aligned}\nabla f(x, y, z) &= f_x(x, y, z)\mathbf{i} + f_y(x, y, z)\mathbf{j} + f_z(x, y, z)\mathbf{k} \\ &= 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} \qquad \text{Vector field in space}\end{aligned}$$

is a vector field in space. Note that the component functions for this particular vector field are $2x$, $2y$, and $2z$.

A vector field

$$\mathbf{F}(x, y, z) = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}$$

is **continuous** at a point if and only if each of its component functions M, N, and P is continuous at that point.

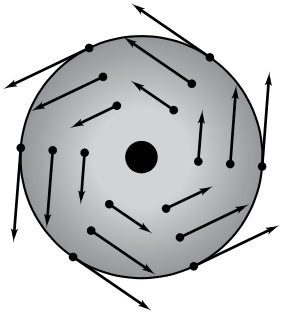
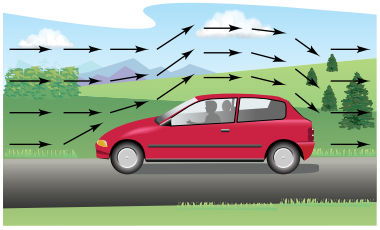
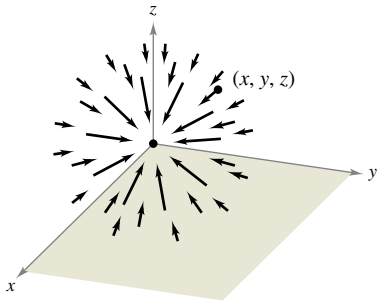
Velocity field



Rotating wheel
Figure 15.1



Air flow vector field
Figure 15.2



m_1 is located at (x, y, z).
m_2 is located at $(0, 0, 0)$.
Gravitational force field
Figure 15.3

Some common *physical* examples of vector fields are **velocity fields, gravitational fields,** and **electric force fields.**

1. *Velocity fields* describe the motions of systems of particles in the plane or in space. For instance, Figure 15.1 shows the vector field determined by a wheel rotating on an axle. Notice that the velocity vectors are determined by the locations of their initial points—the farther a point is from the axle, the greater its velocity. Velocity fields are also determined by the flow of liquids through a container or by the flow of air currents around a moving object, as shown in Figure 15.2.
2. *Gravitational fields* are defined by **Newton's Law of Gravitation,** which states that the force of attraction exerted on a particle of mass m_1 located at (x, y, z) by a particle of mass m_2 located at $(0, 0, 0)$ is

$$\mathbf{F}(x, y, z) = \frac{-Gm_1m_2}{x^2 + y^2 + z^2}\mathbf{u}$$

where G is the gravitational constant and $\mathbf{u}$ is the unit vector in the direction from the origin to (x, y, z). In Figure 15.3, the gravitational field $\mathbf{F}$ has the properties that $\mathbf{F}(x, y, z)$ always points toward the origin, and that the magnitude of $\mathbf{F}(x, y, z)$ is the same at all points equidistant from the origin. A vector field with these two properties is called a **central force field.** Using the position vector

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$$

for the point (x, y, z), you can write the gravitational field $\mathbf{F}$ as

$$\mathbf{F}(x, y, z) = \frac{-Gm_1m_2}{\|\mathbf{r}\|^2}\left(\frac{\mathbf{r}}{\|\mathbf{r}\|}\right) = \frac{-Gm_1m_2}{\|\mathbf{r}\|^2}\mathbf{u}.$$

3. *Electric force fields* are defined by **Coulomb's Law,** which states that the force exerted on a particle with electric charge q_1 located at (x, y, z) by a particle with electric charge q_2 located at $(0, 0, 0)$ is

$$\mathbf{F}(x, y, z) = \frac{cq_1q_2}{\|\mathbf{r}\|^2}\mathbf{u}$$

where $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, $\mathbf{u} = \mathbf{r}/\|\mathbf{r}\|$, and c is a constant that depends on the choice of units for $\|\mathbf{r}\|$, q_1, and q_2.

Note that an electric force field has the same form as a gravitational field. That is,

$$\mathbf{F}(x, y, z) = \frac{k}{\|\mathbf{r}\|^2}\mathbf{u}.$$

Such a force field is called an **inverse square field.**

Definition of Inverse Square Field

Let $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ be a position vector. The vector field $\mathbf{F}$ is an **inverse square field** if

$$\mathbf{F}(x, y, z) = \frac{k}{\|\mathbf{r}\|^2}\mathbf{u}$$

where k is a real number and

$$\mathbf{u} = \frac{\mathbf{r}}{\|\mathbf{r}\|}$$

is a unit vector in the direction of $\mathbf{r}$.

Because vector fields consist of infinitely many vectors, it is not possible to create a sketch of the entire field. Instead, when you sketch a vector field, your goal is to sketch representative vectors that help you visualize the field.

EXAMPLE 1 Sketching a Vector Field

Sketch some vectors in the vector field

$$\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}.$$

Solution You could plot vectors at several random points in the plane. It is more enlightening, however, to plot vectors of equal magnitude. This corresponds to finding level curves in scalar fields. In this case, vectors of equal magnitude lie on circles.

$$\|\mathbf{F}\| = c \qquad \text{Vectors of length } c$$
$$\sqrt{x^2 + y^2} = c$$
$$x^2 + y^2 = c^2 \qquad \text{Equation of circle}$$

To begin making the sketch, choose a value for c and plot several vectors on the resulting circle. For instance, the following vectors occur on the unit circle.

Point	Vector
$(1, 0)$	$\mathbf{F}(1, 0) = \mathbf{j}$
$(0, 1)$	$\mathbf{F}(0, 1) = -\mathbf{i}$
$(-1, 0)$	$\mathbf{F}(-1, 0) = -\mathbf{j}$
$(0, -1)$	$\mathbf{F}(0, -1) = \mathbf{i}$

These and several other vectors in the vector field are shown in Figure 15.4. Note in the figure that this vector field is similar to that given by the rotating wheel shown in Figure 15.1.

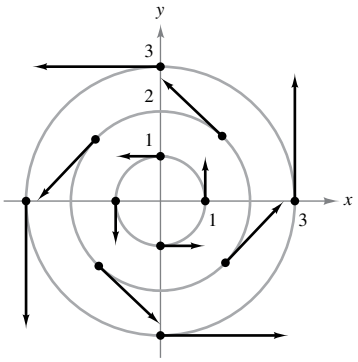

Figure 15.4

EXAMPLE 2 Sketching a Vector Field

Sketch some vectors in the vector field

$$\mathbf{F}(x, y) = 2x\mathbf{i} + y\mathbf{j}.$$

Solution For this vector field, vectors of equal magnitude lie on ellipses given by

$$\|\mathbf{F}\| = c$$
$$\sqrt{(2x)^2 + (y)^2} = c$$

which implies that

$$4x^2 + y^2 = c^2. \qquad \text{Equation of ellipse}$$

For $c = 1$, sketch several vectors $2x\mathbf{i} + y\mathbf{j}$ of magnitude 1 at points on the ellipse given by

$$4x^2 + y^2 = 1.$$

For $c = 2$, sketch several vectors $2x\mathbf{i} + y\mathbf{j}$ of magnitude 2 at points on the ellipse given by

$$4x^2 + y^2 = 4.$$

These vectors are shown in Figure 15.5.

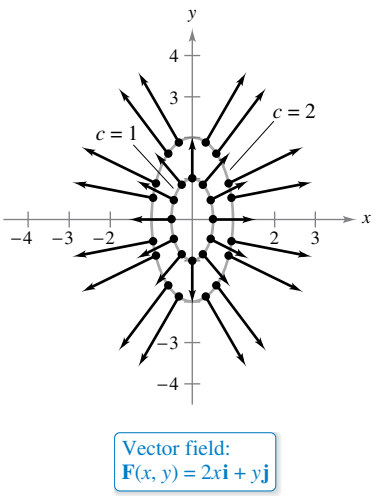

Figure 15.5

TECHNOLOGY A graphing utility can be used to graph vectors in a vector field. If you have access to a graphing utility, use it to graph several representative vectors for the vector field in Example 2.

Velocity field:
$\mathbf{v}(x, y, z) = (16 - x^2 - y^2)\mathbf{k}$

Figure 15.6

EXAMPLE 3 Sketching a Velocity Field

Sketch some vectors in the velocity field

$$\mathbf{v}(x, y, z) = (16 - x^2 - y^2)\mathbf{k}$$

where $x^2 + y^2 \leq 16$.

Solution You can imagine that $\mathbf{v}$ describes the velocity of a liquid flowing through a tube of radius 4. Vectors near the z-axis are longer than those near the edge of the tube. For instance, at the point $(0, 0, 0)$, the velocity vector is $\mathbf{v}(0, 0, 0) = 16\mathbf{k}$, whereas at the point $(0, 3, 0)$, the velocity vector is $\mathbf{v}(0, 3, 0) = 7\mathbf{k}$. Figure 15.6 shows these and several other vectors for the velocity field. From the figure, notice that the speed of the liquid is greater near the center of the tube than near the edges of the tube. ■

Conservative Vector Fields

Notice in Figure 15.5 that all the vectors appear to be normal to the level curve from which they emanate. Because this is a property of gradients, it is natural to ask whether the vector field

$$\mathbf{F}(x, y) = 2x\mathbf{i} + y\mathbf{j}$$

is the *gradient* of some differentiable function f. The answer is that some vector fields can be represented as the gradients of differentiable functions and some cannot—those that can are called **conservative** vector fields.

Definition of Conservative Vector Field

A vector field $\mathbf{F}$ is called **conservative** when there exists a differentiable function f such that $\mathbf{F} = \nabla f$. The function f is called the **potential function** for $\mathbf{F}$.

EXAMPLE 4 Conservative Vector Fields

a. The vector field given by $\mathbf{F}(x, y) = 2x\mathbf{i} + y\mathbf{j}$ is conservative. To show this, consider the potential function $f(x, y) = x^2 + \frac{1}{2}y^2$. Because

$$\nabla f = 2x\mathbf{i} + y\mathbf{j} = \mathbf{F}$$

it follows that $\mathbf{F}$ is conservative.

b. Every inverse square field is conservative. To show this, let

$$\mathbf{F}(x, y, z) = \frac{k}{\|\mathbf{r}\|^2}\mathbf{u} \quad \text{and} \quad f(x, y, z) = \frac{-k}{\sqrt{x^2 + y^2 + z^2}}$$

where $\mathbf{u} = \mathbf{r}/\|\mathbf{r}\|$. Because

$$\begin{aligned}\nabla f &= \frac{kx}{(x^2 + y^2 + z^2)^{3/2}}\mathbf{i} + \frac{ky}{(x^2 + y^2 + z^2)^{3/2}}\mathbf{j} + \frac{kz}{(x^2 + y^2 + z^2)^{3/2}}\mathbf{k} \\ &= \frac{k}{x^2 + y^2 + z^2}\left(\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}\right) \\ &= \frac{k}{\|\mathbf{r}\|^2}\left(\frac{\mathbf{r}}{\|\mathbf{r}\|}\right) \\ &= \frac{k}{\|\mathbf{r}\|^2}\mathbf{u}\end{aligned}$$

it follows that $\mathbf{F}$ is conservative. ■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

As can be seen in Example 4(b), many important vector fields, including gravitational fields and electric force fields, are conservative. Most of the terminology in this chapter comes from physics. For example, the term "conservative" is derived from the classic physical law regarding the conservation of energy. This law states that the sum of the kinetic energy and the potential energy of a particle moving in a conservative force field is constant. (The kinetic energy of a particle is the energy due to its motion, and the potential energy is the energy due to its position in the force field.)

The next theorem gives a necessary and sufficient condition for a vector field *in the plane* to be conservative.

REMARK Theorem 15.1 is valid on *simply connected* domains. A plane region R is simply connected when every simple closed curve in R encloses only points that are in R. (See Figure 15.26 in Section 15.4.)

THEOREM 15.1 Test for Conservative Vector Field in the Plane

Let M and N have continuous first partial derivatives on an open disk R. The vector field $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$ is conservative if and only if

$$\frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}.$$

Proof To prove that the given condition is necessary for $\mathbf{F}$ to be conservative, suppose there exists a potential function f such that

$$\mathbf{F}(x, y) = \nabla f(x, y) = M\mathbf{i} + N\mathbf{j}.$$

Then you have

$$f_x(x, y) = M \quad \Rightarrow \quad f_{xy}(x, y) = \frac{\partial M}{\partial y}$$

$$f_y(x, y) = N \quad \Rightarrow \quad f_{yx}(x, y) = \frac{\partial N}{\partial x}$$

and, by the equivalence of the mixed partials f_{xy} and f_{yx}, you can conclude that $\partial N/\partial x = \partial M/\partial y$ for all (x, y) in R. The sufficiency of this condition is proved in Section 15.4. ■

EXAMPLE 5 Testing for Conservative Vector Fields in the Plane

Determine whether the vector field given by $\mathbf{F}$ is conservative.

a. $\mathbf{F}(x, y) = x^2y\mathbf{i} + xy\mathbf{j}$

b. $\mathbf{F}(x, y) = 2x\mathbf{i} + y\mathbf{j}$

Solution

a. The vector field

$$\mathbf{F}(x, y) = x^2y\mathbf{i} + xy\mathbf{j}$$

is not conservative because

$$\frac{\partial M}{\partial y} = \frac{\partial}{\partial y}[x^2y] = x^2 \quad \text{and} \quad \frac{\partial N}{\partial x} = \frac{\partial}{\partial x}[xy] = y.$$

b. The vector field

$$\mathbf{F}(x, y) = 2x\mathbf{i} + y\mathbf{j}$$

is conservative because

$$\frac{\partial M}{\partial y} = \frac{\partial}{\partial y}[2x] = 0 \quad \text{and} \quad \frac{\partial N}{\partial x} = \frac{\partial}{\partial x}[y] = 0.$$

■

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Theorem 15.1 tells you whether a vector field $\mathbf{F}$ is conservative. It does not tell you how to find a potential function of $\mathbf{F}$. The problem is comparable to antidifferentiation. Sometimes you will be able to find a potential function by simple inspection. For instance, in Example 4, you observed that

$$f(x, y) = x^2 + \frac{1}{2}y^2$$

has the property that

$$\nabla f(x, y) = 2x\mathbf{i} + y\mathbf{j}.$$

EXAMPLE 6 Finding a Potential Function for $\mathbf{F}(x, y)$

Find a potential function for

$$\mathbf{F}(x, y) = 2xy\mathbf{i} + (x^2 - y)\mathbf{j}.$$

Solution From Theorem 15.1, it follows that $\mathbf{F}$ is conservative because

$$\frac{\partial}{\partial y}[2xy] = 2x \quad \text{and} \quad \frac{\partial}{\partial x}[x^2 - y] = 2x.$$

If f is a function whose gradient is equal to $\mathbf{F}(x, y)$, then

$$\nabla f(x, y) = 2xy\mathbf{i} + (x^2 - y)\mathbf{j}$$

which implies that

$$f_x(x, y) = 2xy$$

and

$$f_y(x, y) = x^2 - y.$$

To reconstruct the function f from these two partial derivatives, integrate $f_x(x, y)$ with respect to x

$$f(x, y) = \int f_x(x, y)\, dx = \int 2xy\, dx = x^2y + g(y)$$

and integrate $f_y(x, y)$ with respect to y

$$f(x, y) = \int f_y(x, y)\, dy = \int (x^2 - y)\, dy = x^2y - \frac{y^2}{2} + h(x).$$

Notice that $g(y)$ is constant with respect to x and $h(x)$ is constant with respect to y. To find a single expression that represents $f(x, y)$, let

$$g(y) = -\frac{y^2}{2} + K_1 \quad \text{and} \quad h(x) = K_2.$$

Then you can write

$$f(x, y) = x^2y - \frac{y^2}{2} + K. \qquad K = K_1 + K_2$$

You can check this result by forming the gradient of f. You will find that it is equal to the original function $\mathbf{F}$. ■

Notice that the solution to Example 6 is comparable to that given by an indefinite integral. That is, the solution represents a family of potential functions, any two of which differ by a constant. To find a unique solution, you would have to be given an initial condition that is satisfied by the potential function.

Curl of a Vector Field

Theorem 15.1 has a counterpart for vector fields in space. Before stating that result, the definition of the **curl of a vector field** in space is given.

Definition of Curl of a Vector Field

The curl of $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is

$$\begin{aligned}\operatorname{curl} \mathbf{F}(x, y, z) &= \nabla \times \mathbf{F}(x, y, z) \\ &= \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} - \left(\frac{\partial P}{\partial x} - \frac{\partial M}{\partial z}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}.\end{aligned}$$

If curl $\mathbf{F} = \mathbf{0}$, then $\mathbf{F}$ is said to be **irrotational.**

The cross-product notation used for curl comes from viewing the gradient ∇f as the result of the **differential operator** ∇ acting on the function f. In this context, you can use the following determinant form as an aid in remembering the formula for curl.

$$\begin{aligned}\operatorname{curl} \mathbf{F}(x, y, z) &= \nabla \times \mathbf{F}(x, y, z) \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ M & N & P \end{vmatrix} \\ &= \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} - \left(\frac{\partial P}{\partial x} - \frac{\partial M}{\partial z}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}\end{aligned}$$

EXAMPLE 7 Finding the Curl of a Vector Field

See LarsonCalculus.com for an interactive version of this type of example.

Find curl $\mathbf{F}$ of the vector field

$$\mathbf{F}(x, y, z) = 2xy\mathbf{i} + (x^2 + z^2)\mathbf{j} + 2yz\mathbf{k}.$$

Is $\mathbf{F}$ irrotational?

Solution The curl of $\mathbf{F}$ is

$$\begin{aligned}\operatorname{curl} \mathbf{F}(x, y, z) &= \nabla \times \mathbf{F}(x, y, z) \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ 2xy & x^2 + z^2 & 2yz \end{vmatrix} \\ &= \begin{vmatrix} \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ x^2 + z^2 & 2yz \end{vmatrix}\mathbf{i} - \begin{vmatrix} \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial z} \\ 2xy & 2yz \end{vmatrix}\mathbf{j} + \begin{vmatrix} \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} \\ 2xy & x^2 + z^2 \end{vmatrix}\mathbf{k} \\ &= (2z - 2z)\mathbf{i} - (0 - 0)\mathbf{j} + (2x - 2x)\mathbf{k} \\ &= \mathbf{0}.\end{aligned}$$

Because curl $\mathbf{F} = \mathbf{0}$, $\mathbf{F}$ is irrotational. ■

TECHNOLOGY Some graphing utilities have a command that can be used to find the curl of a vector field. If you have access to a graphing utility that has such a command, use it to find the curl of the vector field in Example 7.

GO DIGITAL

Later in this chapter, you will assign a physical interpretation to the curl of a vector field. But for now, the primary use of curl is shown in the following test for conservative vector fields in space. The test states that for a vector field in space, the curl is $\mathbf{0}$ at every point in its domain if and only if $\mathbf{F}$ is conservative. The proof is similar to that given for Theorem 15.1.

REMARK Theorem 15.2 is valid for *simply connected* domains in space. A simply connected domain in space is a domain D for which every simple closed curve in D can be shrunk to a point in D without leaving D.

THEOREM 15.2 Test for Conservative Vector Field in Space

Suppose that M, N, and P have continuous first partial derivatives in an open sphere Q in space. The vector field

$$\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$$

is conservative if and only if

$$\text{curl } \mathbf{F}(x, y, z) = \mathbf{0}.$$

That is, $\mathbf{F}$ is conservative if and only if

$$\frac{\partial P}{\partial y} = \frac{\partial N}{\partial z}, \quad \frac{\partial P}{\partial x} = \frac{\partial M}{\partial z}, \quad \text{and} \quad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}.$$

From Theorem 15.2, you can conclude that the vector field given in Example 7 is conservative because curl $\mathbf{F}(x, y, z) = \mathbf{0}$. Try showing that the vector field

$$\mathbf{F}(x, y, z) = x^3y^2z\mathbf{i} + x^2z\mathbf{j} + x^2y\mathbf{k}$$

is not conservative—you can do this by showing that its curl is

$$\text{curl } \mathbf{F}(x, y, z) = (x^3y^2 - 2xy)\mathbf{j} + (2xz - 2x^3yz)\mathbf{k} \neq \mathbf{0}.$$

For vector fields in space that pass the test for being conservative, you can find a potential function by following the same pattern used in the plane (as demonstrated in Example 6).

REMARK Examples 6 and 8 are illustrations of a type of problem called *recovering a function from its gradient*. If you go on to take a course in differential equations, you will study other methods for solving this type of problem. One popular method gives an interplay between successive "partial integrations" and partial differentiations.

EXAMPLE 8 Finding a Potential Function for $\mathbf{F}(x, y, z)$

Find a potential function for

$$\mathbf{F}(x, y, z) = 2xy\mathbf{i} + (x^2 + z^2)\mathbf{j} + 2yz\mathbf{k}.$$

Solution From Example 7, you know that the vector field given by $\mathbf{F}$ is conservative. If f is a function such that $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$, then

$$f_x(x, y, z) = 2xy, \quad f_y(x, y, z) = x^2 + z^2, \quad \text{and} \quad f_z(x, y, z) = 2yz$$

and integrating with respect to x, y, and z separately produces

$$f(x, y, z) = \int M\,dx = \int 2xy\,dx = x^2y + g(y, z)$$

$$f(x, y, z) = \int N\,dy = \int (x^2 + z^2)\,dy = x^2y + yz^2 + h(x, z)$$

$$f(x, y, z) = \int P\,dz = \int 2yz\,dz = yz^2 + k(x, y).$$

Comparing these three versions of $f(x, y, z)$, you can conclude that

$$g(y, z) = yz^2 + K_1, \quad h(x, z) = K_2, \quad \text{and} \quad k(x, y) = x^2y + K_3.$$

So, $f(x, y, z)$ is given by

$$f(x, y, z) = x^2y + yz^2 + K. \qquad K = K_1 + K_2 + K_3$$

Divergence of a Vector Field

You have learned that the curl of a vector field $\mathbf{F}$ is itself a vector field. Another important function defined on a vector field is **divergence,** which is a scalar function.

Definition of Divergence of a Vector Field

The **divergence** of $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$ is

$$\operatorname{div} \mathbf{F}(x, y) = \nabla \cdot \mathbf{F}(x, y) = \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}.$$ Plane

The **divergence** of $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is

$$\operatorname{div} \mathbf{F}(x, y, z) = \nabla \cdot \mathbf{F}(x, y, z) = \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z}.$$ Space

If $\operatorname{div} \mathbf{F} = 0$, then $\mathbf{F}$ is said to be **divergence free.**

The dot product notation used for divergence comes from considering ∇ as a **differential operator,** as follows.

$$\begin{aligned}\nabla \cdot \mathbf{F}(x, y, z) &= \left[\left(\frac{\partial}{\partial x}\right)\mathbf{i} + \left(\frac{\partial}{\partial y}\right)\mathbf{j} + \left(\frac{\partial}{\partial z}\right)\mathbf{k}\right] \cdot (M\mathbf{i} + N\mathbf{j} + P\mathbf{k}) \\ &= \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z}\end{aligned}$$

TECHNOLOGY

Some graphing utilities have a command that can be used to find the divergence of a vector field. If you have access to a graphing utility that has this feature, use it to find the divergence of the vector field in Example 9.

EXAMPLE 9 Finding the Divergence of a Vector Field

Find the divergence at $(2, 1, -1)$ for the vector field

$$\mathbf{F}(x, y, z) = x^3y^2z\mathbf{i} + x^2z\mathbf{j} + x^2y\mathbf{k}.$$

Solution The divergence of $\mathbf{F}$ is

$$\operatorname{div} \mathbf{F}(x, y, z) = \frac{\partial}{\partial x}[x^3y^2z] + \frac{\partial}{\partial y}[x^2z] + \frac{\partial}{\partial z}[x^2y] = 3x^2y^2z.$$

At the point $(2, 1, -1)$, the divergence is

$$\operatorname{div} \mathbf{F}(2, 1, -1) = 3(2^2)(1^2)(-1) = -12.$$ ■

Divergence can be viewed as a type of derivative of $\mathbf{F}$ in that, for vector fields representing velocities of moving particles, the divergence measures the rate of particle flow per unit volume at a point. In hydrodynamics (the study of fluid motion), a velocity field that is divergence free is called **incompressible.** In the study of electricity and magnetism, a vector field that is divergence free is called **solenoidal.**

There are many important properties of the divergence and curl of a vector field $\mathbf{F}$ [see Exercise 77(a)–(g)]. One that is used often is described in Theorem 15.3. You are asked to prove this theorem in Exercise 77(h).

THEOREM 15.3 Divergence and Curl

If $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is a vector field, and M, N, and P have continuous second partial derivatives, then

$$\operatorname{div}(\operatorname{curl} \mathbf{F}) = 0.$$

15.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

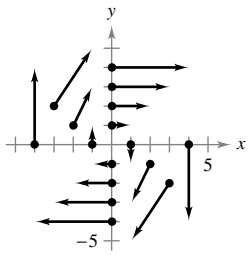
GO DIGITAL

Concept Check

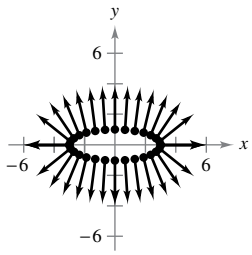
1. Define a vector field in the plane and in space. Give some physical examples of vector fields.
2. What is a conservative vector field? Explain how to test whether a vector field is conservative in the plane and in space.
3. Describe how to find a potential function for a vector field that is conservative.
4. A vector field in space is conservative. Is the vector field irrotational? Explain.

Matching In Exercises 5–8, match the vector field with its graph. [The graphs are labeled (a), (b), (c), and (d).]

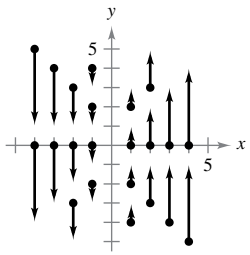
(a)



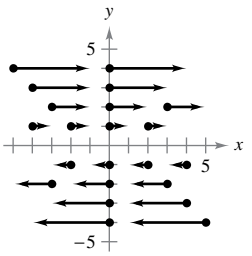
(b)



(c)



(d)



5. $\mathbf{F}(x, y) = y\mathbf{i}$
6. $\mathbf{F}(x, y) = x\mathbf{j}$
7. $\mathbf{F}(x, y) = y\mathbf{i} - x\mathbf{j}$
8. $\mathbf{F}(x, y) = x\mathbf{i} + 3y\mathbf{j}$

Sketching a Vector Field In Exercises 9–14, find $\|\mathbf{F}\|$ and sketch several representative vectors in the vector field.

9. $\mathbf{F}(x, y) = \mathbf{i} + \mathbf{j}$
10. $\mathbf{F}(x, y) = y\mathbf{i} - 2x\mathbf{j}$
11. $\mathbf{F}(x, y) = -\mathbf{i} + 3y\mathbf{j}$
12. $\mathbf{F}(x, y) = y\mathbf{i} + x\mathbf{j}$
13. $\mathbf{F}(x, y, z) = \mathbf{i} + \mathbf{j} + \mathbf{k}$
14. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

Graphing a Vector Field Using Technology In Exercises 15–18, use a graphing utility to graph several representative vectors in the vector field.

15. $\mathbf{F}(x, y) = \frac{1}{8}(2xy\mathbf{i} + y^2\mathbf{j})$
16. $\mathbf{F}(x, y) = \langle 2y - x, 2y + x \rangle$
17. $\mathbf{F}(x, y, z) = \dfrac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$
18. $\mathbf{F}(x, y, z) = \langle x, -y, z \rangle$

Finding a Conservative Vector Field In Exercises 19–28, find the conservative vector field for the potential function by finding its gradient.

19. $f(x, y) = x^2 + 2y^2$
20. $f(x, y) = x^3 - 2xy$
21. $g(x, y) = 5x^2 + 3xy + y^2$
22. $g(x, y) = \sin 3x \cos 4y$
23. $f(x, y, z) = 6xyz$
24. $f(x, y, z) = \sqrt{x^2y + z^2}$
25. $g(x, y, z) = z + ye^{x^2}$
26. $g(x, y, z) = \dfrac{y}{z} + \dfrac{z}{x} - \dfrac{xz}{y}$
27. $h(x, y, z) = xy \ln(x + y)$
28. $h(x, y, z) = x \arcsin yz$

Testing for a Conservative Vector Field In Exercises 29–36, determine whether the vector field is conservative.

29. $\mathbf{F}(x, y) = xy^2\mathbf{i} + x^2y\mathbf{j}$
30. $\mathbf{F}(x, y) = \dfrac{1}{x^2}(y\mathbf{i} - x\mathbf{j})$
31. $\mathbf{F}(x, y) = \sin y\mathbf{i} + x \sin y\mathbf{j}$
32. $\mathbf{F}(x, y) = 5y^2(y\mathbf{i} + 2x\mathbf{j})$
33. $\mathbf{F}(x, y) = \dfrac{1}{xy}(y\mathbf{i} - x\mathbf{j})$
34. $\mathbf{F}(x, y) = \dfrac{2}{y^2}e^{2x/y}(y\mathbf{i} - x\mathbf{j})$
35. $\mathbf{F}(x, y) = \dfrac{\mathbf{i} + \mathbf{j}}{\sqrt{x^2 + y^2}}$
36. $\mathbf{F}(x, y) = \dfrac{y\mathbf{i} + x\mathbf{j}}{\sqrt{1 + xy}}$

Finding a Potential Function In Exercises 37–44, determine whether the vector field is conservative. If it is, find a potential function for the vector field.

37. $\mathbf{F}(x, y) = (3y - x^2)\mathbf{i} + (3x + y)\mathbf{j}$
38. $\mathbf{F}(x, y) = (x^3 + e^y)\mathbf{i} + (xe^y - 6)\mathbf{j}$
39. $\mathbf{F}(x, y) = xe^{x^2y}(2y\mathbf{i} + x\mathbf{j})$
40. $\mathbf{F}(x, y) = \dfrac{1}{y^2}(y\mathbf{i} - 2x\mathbf{j})$
41. $\mathbf{F}(x, y) = \dfrac{2y}{x}\mathbf{i} - \dfrac{x^2}{y^2}\mathbf{j}$
42. $\mathbf{F}(x, y) = \dfrac{x\mathbf{i} + y\mathbf{j}}{x^2 + y^2}$
43. $\mathbf{F}(x, y) = \sin y\mathbf{i} + x \cos y\mathbf{j}$
44. $\mathbf{F}(x, y) = (\ln y + 2)\mathbf{i} + \dfrac{x}{y}\mathbf{j}$

Finding the Curl of a Vector Field In Exercises 45–48, find the curl of the vector field at the given point.

45. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + xyz\mathbf{j} + xyz\mathbf{k}$; $(2, 1, 3)$
46. $\mathbf{F}(x, y, z) = x^2z\mathbf{i} - 2xz\mathbf{j} + yz\mathbf{k}$; $(2, -1, 3)$
47. $\mathbf{F}(x, y, z) = e^x \sin y\mathbf{i} - e^x \cos y\mathbf{j}$; $(0, 0, 1)$
48. $\mathbf{F}(x, y, z) = e^{-xyz}(\mathbf{i} + \mathbf{j} + \mathbf{k})$; $(3, 2, 0)$

Finding the Curl of a Vector Field Using Technology In Exercises 49 and 50, use a graphing utility to find the curl of the vector field.

49. $\mathbf{F}(x, y, z) = \arctan\left(\dfrac{x}{y}\right)\mathbf{i} + \ln\sqrt{x^2 + y^2}\,\mathbf{j} + \mathbf{k}$
50. $\mathbf{F}(x, y, z) = \dfrac{yz}{y - z}\mathbf{i} + \dfrac{xz}{x - z}\mathbf{j} + \dfrac{xy}{x - y}\mathbf{k}$

Finding a Potential Function **In Exercises 51–56, determine whether the vector field is conservative. If it is, find a potential function for the vector field.**

51. $\mathbf{F}(x, y, z) = (3x^2 + yz)\mathbf{i} + (3y^2 + xz)\mathbf{j} + (3z^2 + xy)\mathbf{k}$

52. $\mathbf{F}(x, y, z) = y^2z^3\mathbf{i} + 2xyz^3\mathbf{j} + 3xy^2z^2\mathbf{k}$

53. $\mathbf{F}(x, y, z) = \sin z\mathbf{i} + \sin x\mathbf{j} + \sin y\mathbf{k}$

54. $\mathbf{F}(x, y, z) = ye^z\mathbf{i} + ze^x\mathbf{j} + xe^y\mathbf{k}$

55. $\mathbf{F}(x, y, z) = \frac{z}{y}\mathbf{i} - \frac{xz}{y^2}\mathbf{j} + \left(\frac{x}{y} - 1\right)\mathbf{k}$

56. $\mathbf{F}(x, y, z) = \frac{x}{x^2 + y^2}\mathbf{i} + \frac{y}{x^2 + y^2}\mathbf{j} + \mathbf{k}$

Finding the Divergence of a Vector Field **In Exercises 57–60, find the divergence of the vector field.**

57. $\mathbf{F}(x, y) = x^2\mathbf{i} + 2y^2\mathbf{j}$

58. $\mathbf{F}(x, y) = xe^x\mathbf{i} - x^2y^2\mathbf{j}$

59. $\mathbf{F}(x, y, z) = \sin^2 x\mathbf{i} + z\cos z\mathbf{j} + z^3\mathbf{k}$

60. $\mathbf{F}(x, y, z) = \ln(x^2 + y^2)\mathbf{i} + xy\mathbf{j} + \ln(y^2 + z^2)\mathbf{k}$

Finding the Divergence of a Vector Field **In Exercises 61–64, find the divergence of the vector field at the given point.**

61. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + xz^2\mathbf{j} + 3yz^2\mathbf{k};\ (2, 4, 1)$

62. $\mathbf{F}(x, y, z) = x^2z\mathbf{i} - 2xz\mathbf{j} + yz\mathbf{k};\ (2, -1, 3)$

63. $\mathbf{F}(x, y, z) = e^x \sin y\mathbf{i} - e^x \cos y\mathbf{j} + z^2\mathbf{k};\ (3, 0, 0)$

64. $\mathbf{F}(x, y, z) = \ln(xyz)(\mathbf{i} + \mathbf{j} + \mathbf{k});\ (3, 2, 1)$

Exploring Concepts

In Exercises 65–67, consider a scalar function f and a vector field $\mathbf{F}$ in space. Determine whether the expression is a vector field, a scalar function, or neither. Explain.

65. $\text{curl}(\nabla f)$ **66.** $\text{div}[\text{curl}(\nabla f)]$

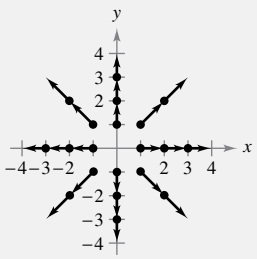
67. $\text{curl}(\text{div}\ \mathbf{F})$

68. HOW DO YOU SEE IT? Several representative vectors in the vector fields

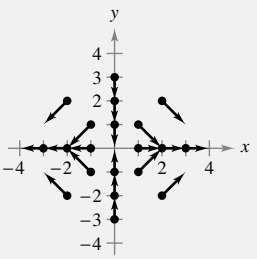
$$\mathbf{F}(x, y) = \frac{x\mathbf{i} + y\mathbf{j}}{\sqrt{x^2 + y^2}} \quad \text{and} \quad \mathbf{G}(x, y) = \frac{x\mathbf{i} - y\mathbf{j}}{\sqrt{x^2 + y^2}}$$

are shown below. Match each vector field with its graph. Explain your reasoning.

(a)



(b)



Curl of a Cross Product **In Exercises 69 and 70, find $\text{curl}(\mathbf{F} \times \mathbf{G}) = \nabla \times (\mathbf{F} \times \mathbf{G})$.**

69. $\mathbf{F}(x, y, z) = \mathbf{i} + 3x\mathbf{j} + 2y\mathbf{k}$
$\mathbf{G}(x, y, z) = x\mathbf{i} - y\mathbf{j} + z\mathbf{k}$

70. $\mathbf{F}(x, y, z) = x\mathbf{i} - z\mathbf{k}$
$\mathbf{G}(x, y, z) = x^2\mathbf{i} + y\mathbf{j} + z^2\mathbf{k}$

Curl of the Curl of a Vector Field **In Exercises 71 and 72, find $\text{curl}(\text{curl}\ \mathbf{F}) = \nabla \times (\nabla \times \mathbf{F})$.**

71. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

72. $\mathbf{F}(x, y, z) = x^2z\mathbf{i} - 2xz\mathbf{j} + yz\mathbf{k}$

Divergence of a Cross Product **In Exercises 73 and 74, find $\text{div}(\mathbf{F} \times \mathbf{G}) = \nabla \cdot (\mathbf{F} \times \mathbf{G})$.**

73. $\mathbf{F}(x, y, z) = \mathbf{i} + 3x\mathbf{j} + 2y\mathbf{k}$
$\mathbf{G}(x, y, z) = x\mathbf{i} - y\mathbf{j} + z\mathbf{k}$

74. $\mathbf{F}(x, y, z) = x\mathbf{i} - z\mathbf{k}$
$\mathbf{G}(x, y, z) = x^2\mathbf{i} + y\mathbf{j} + z^2\mathbf{k}$

Divergence of the Curl of a Vector Field **In Exercises 75 and 76, find $\text{div}(\text{curl}\ \mathbf{F}) = \nabla \cdot (\nabla \times \mathbf{F})$.**

75. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

76. $\mathbf{F}(x, y, z) = x^2z\mathbf{i} - 2xz\mathbf{j} + yz\mathbf{k}$

77. Proof In parts (a)–(h), prove the property for vector fields $\mathbf{F}$ and $\mathbf{G}$ and scalar function f. (Assume that the required partial derivatives are continuous.)

(a) $\text{curl}(\mathbf{F} + \mathbf{G}) = \text{curl}\ \mathbf{F} + \text{curl}\ \mathbf{G}$

(b) $\text{curl}(\nabla f) = \nabla \times (\nabla f) = \mathbf{0}$

(c) $\text{div}(\mathbf{F} + \mathbf{G}) = \text{div}\ \mathbf{F} + \text{div}\ \mathbf{G}$

(d) $\text{div}(\mathbf{F} \times \mathbf{G}) = (\text{curl}\ \mathbf{F}) \cdot \mathbf{G} - \mathbf{F} \cdot (\text{curl}\ \mathbf{G})$

(e) $\nabla \times [\nabla f + (\nabla \times \mathbf{F})] = \nabla \times (\nabla \times \mathbf{F})$

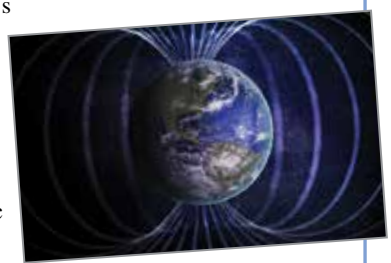
(f) $\nabla \times (f\mathbf{F}) = f(\nabla \times \mathbf{F}) + (\nabla f) \times \mathbf{F}$

(g) $\text{div}(f\mathbf{F}) = f\,\text{div}\ \mathbf{F} + \nabla f \cdot \mathbf{F}$

(h) $\text{div}(\text{curl}\ \mathbf{F}) = 0$ (Theorem 15.3)

78. Earth's Magnetic Field

A cross section of Earth's magnetic field can be represented as a vector field in which the center of Earth is located at the origin and the positive y-axis points in the direction of the magnetic north pole. The equation for this field is



$$\mathbf{F}(x, y) = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$$
$$= \frac{m}{(x^2 + y^2)^{5/2}}[3xy\mathbf{i} + (2y^2 - x^2)\mathbf{j}]$$

where m is the magnetic moment of Earth. Show that this vector field is conservative.

15.2 Line Integrals

GO DIGITAL

- Describe the concept of a piecewise smooth curve.
- Write and evaluate a line integral.
- Write and evaluate a line integral of a vector field.
- Write and evaluate a line integral in differential form.

Piecewise Smooth Curves

A classic property of gravitational fields is that, subject to certain physical constraints, the work done by gravity on an object moving between two points in the field is independent of the path taken by the object. One of the constraints is that the **path** must be a piecewise smooth curve. Recall that a plane curve C given by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}, \quad a \le t \le b$$ Vector-valued function in the plane

is **smooth** when

$$\frac{dx}{dt} \quad \text{and} \quad \frac{dy}{dt}$$

are continuous on $[a, b]$ and not simultaneously 0 on (a, b). Similarly, a space curve C given by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}, \quad a \le t \le b$$ Vector-valued function in space

is **smooth** when

$$\frac{dx}{dt}, \quad \frac{dy}{dt}, \quad \text{and} \quad \frac{dz}{dt}$$

are continuous on $[a, b]$ and not simultaneously 0 on (a, b). A curve C is **piecewise smooth** when the interval $[a, b]$ can be partitioned into a finite number of subintervals, on each of which C is smooth.

EXAMPLE 1 Finding a Piecewise Smooth Parametrization

Find a piecewise smooth parametrization of the graph of C shown in Figure 15.7.

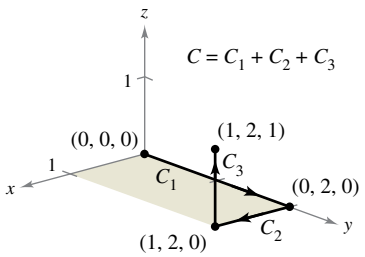

Figure 15.7

Solution Because C consists of three line segments C_1, C_2, and C_3, you can construct a smooth parametrization for each segment and piece them together by making the last t-value in C_i correspond to the first t-value in C_{i+1}.

$$\begin{aligned} C_1\colon\ & x(t) = 0, & y(t) &= 2t, & z(t) &= 0, & 0 \le t \le 1 \\ C_2\colon\ & x(t) = t - 1, & y(t) &= 2, & z(t) &= 0, & 1 \le t \le 2 \\ C_3\colon\ & x(t) = 1, & y(t) &= 2, & z(t) &= t - 2, & 2 \le t \le 3 \end{aligned}$$

So, C is given by

$$\mathbf{r}(t) = \begin{cases} 2t\mathbf{j}, & 0 \le t \le 1 \\ (t-1)\mathbf{i} + 2\mathbf{j}, & 1 \le t \le 2. \\ \mathbf{i} + 2\mathbf{j} + (t-2)\mathbf{k}, & 2 \le t \le 3 \end{cases}$$

Because C_1, C_2, and C_3 are smooth, it follows that C is piecewise smooth. ■

Recall that parametrization of a curve induces an **orientation** to the curve. For instance, in Example 1, the curve is oriented such that the positive direction is from $(0, 0, 0)$, following the curve to $(1, 2, 1)$. Try finding a parametrization that induces the opposite orientation.

JOSIAH WILLARD GIBBS (1839–1903)

Many physicists and mathematicians have contributed to the theory and applications described in this chapter—Newton, Gauss, Laplace, Hamilton, and Maxwell, among others. However, the use of vector analysis to describe these results is attributed primarily to the American mathematical physicist Josiah Willard Gibbs. *See LarsonCalculus.com to read more of this biography.*

Line Integrals

Up to this point in the text, you have studied various types of integrals. For a single integral

$$\int_a^b f(x)\,dx$$ Integrate over interval $[a, b]$.

you integrated over the interval $[a, b]$. Similarly, for a double integral

$$\int_R\int f(x, y)\,dA$$ Integrate over region R.

you integrated over the region R in the plane. In this section, you will study a new type of integral called a **line integral**

$$\int_C f(x, y)\,ds$$ Integrate over curve C.

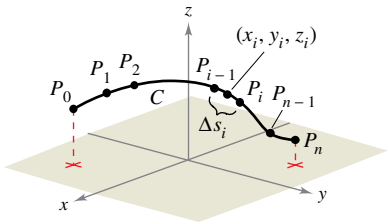
for which you integrate over a piecewise smooth curve C. (The terminology is somewhat unfortunate—this type of integral might be better described as a "curve integral.")

To introduce the concept of a line integral, consider the mass of a wire of finite length, given by a curve C in space. The density (mass per unit length) of the wire at the point (x, y, z) is given by $f(x, y, z)$. Partition the curve C by the points

$$P_0, P_1, \ldots, P_n$$

producing n subarcs, as shown in Figure 15.8. The length of the ith subarc is given by Δs_i. Next, choose a point (x_i, y_i, z_i) in each subarc. If the length of each subarc is small, then the total mass of the wire can be approximated by the sum

$$\text{Mass of wire} \approx \sum_{i=1}^{n} f(x_i, y_i, z_i)\,\Delta s_i.$$



Partitioning of curve C
Figure 15.8

By letting $\|\Delta\|$ denote the length of the longest subarc and letting $\|\Delta\|$ approach 0, it seems reasonable that the limit of this sum approaches the mass of the wire. This leads to the next definition.

Definition of Line Integral

If f is defined in a region containing a smooth curve C of finite length, then the **line integral of f along C** is given by

$$\int_C f(x, y)\,ds = \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(x_i, y_i)\,\Delta s_i$$ Plane

or

$$\int_C f(x, y, z)\,ds = \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(x_i, y_i, z_i)\,\Delta s_i$$ Space

provided this limit exists.

As with the integrals discussed in Chapter 14, evaluation of a line integral is best accomplished by converting it to a definite integral. It can be shown that if f is *continuous*, then the limit given above exists and is the same for all smooth parametrizations of C.

GO DIGITAL

To evaluate a line integral over a plane curve C given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, use the fact that

$$ds = \|\mathbf{r}'(t)\|\,dt = \sqrt{[x'(t)]^2 + [y'(t)]^2}\,dt.$$

A similar formula holds for a space curve, as indicated in Theorem 15.4.

THEOREM 15.4 Evaluation of a Line Integral as a Definite Integral

Let f be continuous in a region containing a smooth curve C. If C is given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, where $a \le t \le b$, then

$$\int_C f(x, y)\,ds = \int_a^b f(x(t), y(t))\sqrt{[x'(t)]^2 + [y'(t)]^2}\,dt.$$

If C is given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$, where $a \le t \le b$, then

$$\int_C f(x, y, z)\,ds = \int_a^b f(x(t), y(t), z(t))\sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\,dt.$$

Note that if $f(x, y, z) = 1$, then the line integral gives the arc length of the curve C, as defined in Section 12.5. That is,

$$\int_C 1\,ds = \int_a^b \|\mathbf{r}'(t)\|\,dt = \text{length of curve } C.$$

EXAMPLE 2 Evaluating a Line Integral

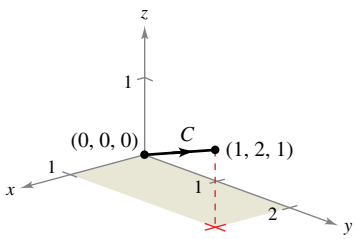

Figure 15.9

Evaluate

$$\int_C (x^2 - y + 3z)\,ds$$

where C is the line segment shown in Figure 15.9.

Solution Begin by writing a parametric form of the equation of the line segment:

$$x = t, \quad y = 2t, \quad \text{and} \quad z = t, \quad 0 \le t \le 1.$$

Therefore, $x'(t) = 1$, $y'(t) = 2$, and $z'(t) = 1$, which implies that

$$\sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2} = \sqrt{1^2 + 2^2 + 1^2} = \sqrt{6}.$$

So, the line integral takes the following form.

$$\begin{aligned}\int_C (x^2 - y + 3z)\,ds &= \int_0^1 (t^2 - 2t + 3t)\sqrt{6}\,dt \\ &= \sqrt{6}\int_0^1 (t^2 + t)\,dt \\ &= \sqrt{6}\left[\frac{t^3}{3} + \frac{t^2}{2}\right]_0^1 \\ &= \frac{5\sqrt{6}}{6}\end{aligned}$$

The value of the line integral in Example 2 does not depend on the parametrization of the line segment C; any smooth parametrization will produce the same value. To convince yourself of this, try some other parametrizations, such as $x = 1 + 2t$, $y = 2 + 4t$, and $z = 1 + 2t$, $-\frac{1}{2} \le t \le 0$, or $x = -t$, $y = -2t$, and $z = -t$, $-1 \le t \le 0$.

GO DIGITAL

Let C be a path composed of smooth curves $C_1, C_2, \ldots, C_n$. If f is continuous on C, then it can be shown that

$$\int_C f(x, y)\, ds = \int_{C_1} f(x, y)\, ds + \int_{C_2} f(x, y)\, ds + \cdots + \int_{C_n} f(x, y)\, ds.$$

This property is used in Example 3.

EXAMPLE 3 Evaluating a Line Integral Over a Path

Evaluate

$$\int_C x\, ds$$

where C is the piecewise smooth curve shown in Figure 15.10.

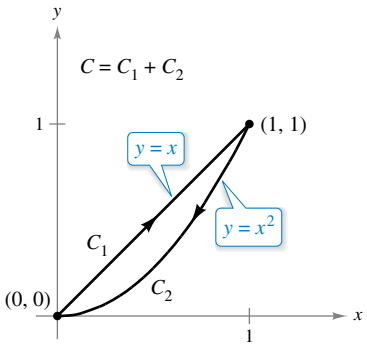

Figure 15.10

Solution Begin by integrating up the line $y = x$, using the following parametrization.

$$C_1\colon\ x = t, \quad y = t, \quad 0 \le t \le 1$$

For this curve, $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}$, which implies that $x'(t) = 1$ and $y'(t) = 1$. So,

$$\sqrt{[x'(t)]^2 + [y'(t)]^2} = \sqrt{2}$$

and you have

$$\int_{C_1} x\, ds = \int_0^1 t\sqrt{2}\, dt = \frac{\sqrt{2}}{2}t^2\Big]_0^1 = \frac{\sqrt{2}}{2}.$$

Next, integrate down the parabola $y = x^2$, using the parametrization

$$C_2\colon x = 1 - t, \quad y = (1 - t)^2, \quad 0 \le t \le 1.$$

For this curve,

$$\mathbf{r}(t) = (1 - t)\mathbf{i} + (1 - t)^2\mathbf{j}$$

which implies that $x'(t) = -1$ and $y'(t) = -2(1 - t)$. So,

$$\sqrt{[x'(t)]^2 + [y'(t)]^2} = \sqrt{1 + 4(1 - t)^2}$$

and you have

$$\begin{aligned}\int_{C_2} x\, ds &= \int_0^1 (1 - t)\sqrt{1 + 4(1 - t)^2}\, dt \\ &= -\frac{1}{8}\left[\frac{2}{3}[1 + 4(1 - t)^2]^{3/2}\right]_0^1 \\ &= \frac{1}{12}(5^{3/2} - 1).\end{aligned}$$

Consequently,

$$\int_C x\, ds = \int_{C_1} x\, ds + \int_{C_2} x\, ds = \frac{\sqrt{2}}{2} + \frac{1}{12}(5^{3/2} - 1) \approx 1.56.$$

For parametrizations given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$, it is helpful to remember the form of ds as

$$ds = \|\mathbf{r}'(t)\|\, dt = \sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\, dt.$$

This is demonstrated in Example 4.

EXAMPLE 4 **Evaluating a Line Integral**

Evaluate $\int_C (x + 2)\, ds$, where C is the curve represented by

$$\mathbf{r}(t) = t\mathbf{i} + \frac{4}{3}t^{3/2}\mathbf{j} + \frac{1}{2}t^2\mathbf{k}, \quad 0 \le t \le 2.$$

Solution Because $\mathbf{r}'(t) = \mathbf{i} + 2t^{1/2}\mathbf{j} + t\mathbf{k}$ and

$$\|\mathbf{r}'(t)\| = \sqrt{[x'(t)^2] + [y'(t)]^2 + [z'(t)]^2} = \sqrt{1 + 4t + t^2}$$

it follows that

$$\begin{aligned}\int_C (x + 2)\, ds &= \int_0^2 (t + 2)\sqrt{1 + 4t + t^2}\, dt \\ &= \frac{1}{2}\int_0^2 2(t + 2)(1 + 4t + t^2)^{1/2}\, dt \\ &= \frac{1}{3}\Big[(1 + 4t + t^2)^{3/2}\Big]_0^2 \\ &= \frac{1}{3}\left(13\sqrt{13} - 1\right) \\ &\approx 15.29.\end{aligned}$$

The next example shows how a line integral can be used to find the mass of a spring whose density varies. In Figure 15.11, note that the density of this spring increases as the spring spirals up the z-axis.

EXAMPLE 5 **Finding the Mass of a Spring**

Find the mass of a spring in the shape of the circular helix

$$\mathbf{r}(t) = \frac{1}{\sqrt{2}}(\cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k})$$

where $0 \le t \le 6\pi$ and the density of the spring is

$$\rho(x, y, z) = 1 + z$$

as shown in Figure 15.11.

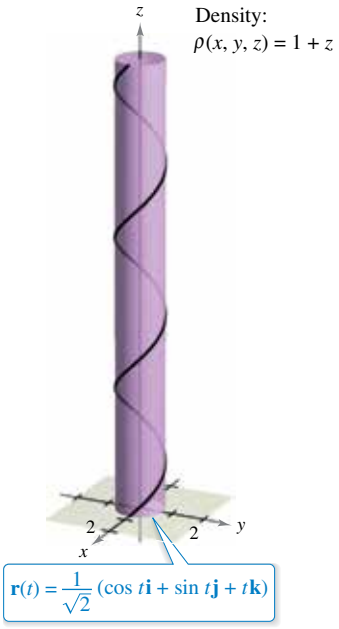

Figure 15.11

Solution Because

$$\|\mathbf{r}'(t)\| = \frac{1}{\sqrt{2}}\sqrt{(-\sin t)^2 + (\cos t)^2 + (1)^2} = 1$$

it follows that the mass of the spring is

$$\begin{aligned}\text{Mass} &= \int_C (1 + z)\, ds \\ &= \int_0^{6\pi} \left(1 + \frac{t}{\sqrt{2}}\right) dt \\ &= \left[t + \frac{t^2}{2\sqrt{2}}\right]_0^{6\pi} \\ &= 6\pi\left(1 + \frac{3\pi}{\sqrt{2}}\right) \\ &\approx 144.47.\end{aligned}$$

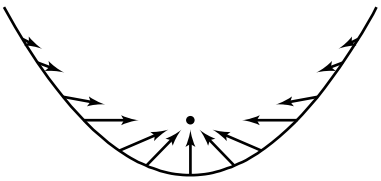
Inverse square force field **F**



Vectors along a parabolic path in the force field **F**

Figure 15.12

Line Integrals of Vector Fields

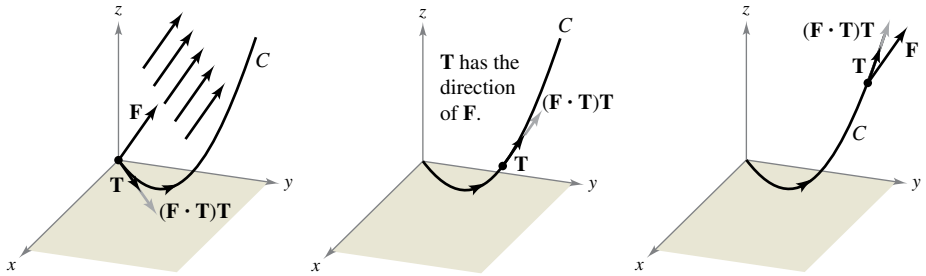
One of the most important physical applications of line integrals is that of finding the **work** done on an object moving in a force field. For example, Figure 15.12 shows an inverse square force field similar to the gravitational field of the sun. Note that the magnitude of the force along a circular path about the center is constant, whereas the magnitude of the force along a parabolic path varies from point to point.

To understand how a line integral can be used to find work done in a force field **F**, consider an object moving along a path C in the field, as shown in Figure 15.13. To determine the work done by the force, you need consider only that part of the force that is acting in the same direction as that in which the object is moving (or the opposite direction). This means that at each point on C, you can consider the projection $\mathbf{F} \cdot \mathbf{T}$ of the force vector $\mathbf{F}$ onto the unit tangent vector $\mathbf{T}$. On a small subarc of length Δs_i, the increment of work is

$$\begin{aligned} \Delta W_i &= (\text{force})(\text{distance}) \\ &\approx [\mathbf{F}(x_i, y_i, z_i) \cdot \mathbf{T}(x_i, y_i, z_i)]\, \Delta s_i \end{aligned}$$

where (x_i, y_i, z_i) is a point in the ith subarc. Consequently, the total work done is given by the integral

$$W = \int_C \mathbf{F}(x, y, z) \cdot \mathbf{T}(x, y, z)\, ds.$$



At each point on C, the force in the direction of motion is $(\mathbf{F} \cdot \mathbf{T})\mathbf{T}$.

Figure 15.13

This line integral appears in other contexts and is the basis of the definition of the **line integral of a vector field** shown below. Note in the definition that

$$\begin{aligned} \mathbf{F} \cdot \mathbf{T}\, ds &= \mathbf{F} \cdot \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} \|\mathbf{r}'(t)\|\, dt \\ &= \mathbf{F} \cdot \mathbf{r}'(t)\, dt \\ &= \mathbf{F} \cdot d\mathbf{r}. \end{aligned}$$

Definition of the Line Integral of a Vector Field

Let $\mathbf{F}$ be a continuous vector field defined on a smooth curve C given by

$$\mathbf{r}(t), \quad a \le t \le b.$$

The **line integral** of $\mathbf{F}$ on C is given by

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \int_C \mathbf{F} \cdot \mathbf{T}\, ds \\ &= \int_a^b \mathbf{F}(x(t), y(t), z(t)) \cdot \mathbf{r}'(t)\, dt. \end{aligned}$$

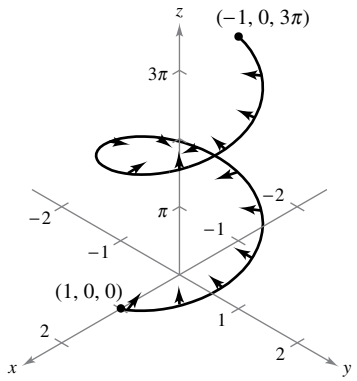

Figure 15.14

GO DIGITAL

EXAMPLE 6 Work Done by a Force

See LarsonCalculus.com for an interactive version of this type of example.

Find the work done by the force field

$$\mathbf{F}(x, y, z) = -\frac{1}{2}x\mathbf{i} - \frac{1}{2}y\mathbf{j} + \frac{1}{4}\mathbf{k}$$ Force field **F**

on a particle as it moves along the helix given by

$$\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}$$ Space curve C

from the point $(1, 0, 0)$ to the point $(-1, 0, 3\pi)$, as shown in Figure 15.14.

Solution Because

$$\begin{aligned}\mathbf{r}(t) &= x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} \\ &= \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}\end{aligned}$$

it follows that

$$x(t) = \cos t, \quad y(t) = \sin t, \quad \text{and} \quad z(t) = t.$$

So, the force field can be written as

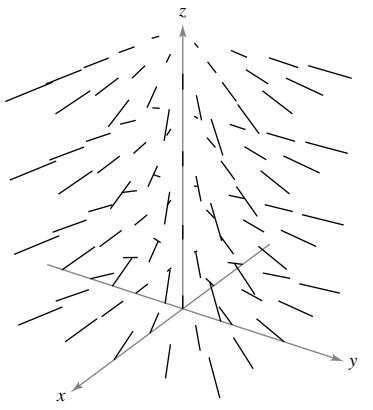
$$\mathbf{F}(x(t), y(t), z(t)) = -\frac{1}{2}\cos t\mathbf{i} - \frac{1}{2}\sin t\mathbf{j} + \frac{1}{4}\mathbf{k}.$$

To find the work done by the force field in moving a particle along the curve C, use the fact that

$$\mathbf{r}'(t) = -\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k}$$

and write the following.

$$\begin{aligned}W &= \int_C \mathbf{F} \cdot d\mathbf{r} \\ &= \int_a^b \mathbf{F}(x(t), y(t), z(t)) \cdot \mathbf{r}'(t)\, dt \\ &= \int_0^{3\pi} \left(-\frac{1}{2}\cos t\mathbf{i} - \frac{1}{2}\sin t\mathbf{j} + \frac{1}{4}\mathbf{k}\right) \cdot (-\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k})\, dt \\ &= \int_0^{3\pi} \left(\frac{1}{2}\sin t\cos t - \frac{1}{2}\sin t\cos t + \frac{1}{4}\right) dt \\ &= \int_0^{3\pi} \frac{1}{4}\, dt \\ &= \frac{1}{4}t\Big]_0^{3\pi} \\ &= \frac{3\pi}{4}\end{aligned}$$



Generated by Mathematica

Figure 15.15

In Example 6, note that the x- and y-components of the force field end up contributing nothing to the total work. This occurs because *in this particular example*, the z-component of the force field is the only portion of the force that is acting in the same (or opposite) direction in which the particle is moving (see Figure 15.15).

TECHNOLOGY Figure 15.15 shows a computer-generated view of the force field in Example 6. The figure indicates that each vector in the force field points toward the z-axis.

GO DIGITAL

For line integrals of vector functions, the orientation of the curve C is important. When the orientation of the curve is reversed, the unit tangent vector $\mathbf{T}(t)$ is changed to $-\mathbf{T}(t)$, and you obtain

$$\int_{-C} \mathbf{F} \cdot d\mathbf{r} = -\int_{C} \mathbf{F} \cdot d\mathbf{r}.$$

EXAMPLE 7 Orientation and Parametrization of a Curve

Let $\mathbf{F}(x, y) = y\mathbf{i} + x^2\mathbf{j}$ and evaluate the line integral

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

for each parabolic curve shown in Figure 15.16.

a. C_1: $\mathbf{r}_1(t) = (4 - t)\mathbf{i} + (4t - t^2)\mathbf{j}, \quad 0 \le t \le 3$

b. C_2: $\mathbf{r}_2(t) = t\mathbf{i} + (4t - t^2)\mathbf{j}, \quad 1 \le t \le 4$

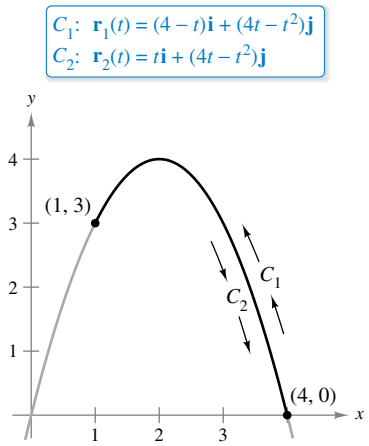

Figure 15.16

Solution

a. Because $\mathbf{r}_1'(t) = -\mathbf{i} + (4 - 2t)\mathbf{j}$ and

$$\mathbf{F}(x(t), y(t)) = (4t - t^2)\mathbf{i} + (4 - t)^2\mathbf{j}$$

the line integral is

$$\begin{aligned}
\int_{C_1} \mathbf{F} \cdot d\mathbf{r} &= \int_0^3 [(4t - t^2)\mathbf{i} + (4 - t)^2\mathbf{j}] \cdot [-\mathbf{i} + (4 - 2t)\mathbf{j}]\, dt \\
&= \int_0^3 (-4t + t^2 + 64 - 64t + 20t^2 - 2t^3)\, dt \\
&= \int_0^3 (-2t^3 + 21t^2 - 68t + 64)\, dt \\
&= \left[-\frac{t^4}{2} + 7t^3 - 34t^2 + 64t\right]_0^3 \\
&= \frac{69}{2}.
\end{aligned}$$

b. Because $\mathbf{r}_2'(t) = \mathbf{i} + (4 - 2t)\mathbf{j}$ and

$$\mathbf{F}(x(t), y(t)) = (4t - t^2)\mathbf{i} + t^2\mathbf{j}$$

the line integral is

$$\begin{aligned}
\int_{C_2} \mathbf{F} \cdot d\mathbf{r} &= \int_1^4 [(4t - t^2)\mathbf{i} + t^2\mathbf{j}] \cdot [\mathbf{i} + (4 - 2t)\mathbf{j}]\, dt \\
&= \int_1^4 (4t - t^2 + 4t^2 - 2t^3)\, dt \\
&= \int_1^4 (-2t^3 + 3t^2 + 4t)\, dt \\
&= \left[-\frac{t^4}{2} + t^3 + 2t^2\right]_1^4 \\
&= -\frac{69}{2}.
\end{aligned}$$

The answer in part (b) is the negative of that in part (a) because C_1 and C_2 represent opposite orientations of the same parabolic segment. ■

REMARK Although the value of the line integral in Example 7 depends on the orientation of C, it does not depend on the parametrization of C. To show this, let C_3 be represented by

$$\mathbf{r}_3(t) = (t + 2)\mathbf{i} + (4 - t^2)\mathbf{j}$$

where $-1 \le t \le 2$. The graph of this curve is the same parabolic segment shown in Figure 15.16. Does the value of the line integral over C_3 agree with the value over C_1 or C_2? Why or why not?

Line Integrals in Differential Form

A second commonly used form of line integrals is derived from the vector field notation used in Section 15.1. If $\mathbf{F}$ is a vector field of the form $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$ and C is given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, then $\mathbf{F} \cdot d\mathbf{r}$ is often written as $M\,dx + N\,dy$.

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= \int_C \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\,dt \\ &= \int_a^b (M\mathbf{i} + N\mathbf{j}) \cdot (x'(t)\mathbf{i} + y'(t)\mathbf{j})\,dt \\ &= \int_a^b \left(M\frac{dx}{dt} + N\frac{dy}{dt}\right) dt \\ &= \int_C (M\,dx + N\,dy)\end{aligned}$$

This **differential form** can be extended to three variables.

REMARK The parentheses are often omitted from this differential form, as shown below.

$$\int_C M\,dx + N\,dy$$

In three variables, the differential form is

$$\int_C M\,dx + N\,dy + P\,dz.$$

EXAMPLE 8 Evaluating a Line Integral in Differential Form

Let C be the circle of radius 3 given by

$$\mathbf{r}(t) = 3\cos t\mathbf{i} + 3\sin t\mathbf{j}, \quad 0 \le t \le 2\pi$$

as shown in Figure 15.17. Evaluate the line integral

$$\int_C y^3\,dx + (x^3 + 3xy^2)\,dy.$$

Solution Because $x = 3\cos t$ and $y = 3\sin t$, you have $dx = -3\sin t\,dt$ and $dy = 3\cos t\,dt$. So, the line integral is

$$\begin{aligned}&\int_C M\,dx + N\,dy \\ &= \int_C y^3\,dx + (x^3 + 3xy^2)\,dy \\ &= \int_0^{2\pi} [(27\sin^3 t)(-3\sin t) + (27\cos^3 t + 81\cos t\sin^2 t)(3\cos t)]\,dt \\ &= 81\int_0^{2\pi} (\cos^4 t - \sin^4 t + 3\cos^2 t\sin^2 t)\,dt \\ &= 81\int_0^{2\pi} \left(\cos^2 t - \sin^2 t + \frac{3}{4}\sin^2 2t\right) dt \\ &= 81\int_0^{2\pi} \left[\cos 2t + \frac{3}{4}\left(\frac{1 - \cos 4t}{2}\right)\right] dt \\ &= 81\left[\frac{\sin 2t}{2} + \frac{3}{8}t - \frac{3\sin 4t}{32}\right]_0^{2\pi} \\ &= \frac{243\pi}{4}.\end{aligned}$$

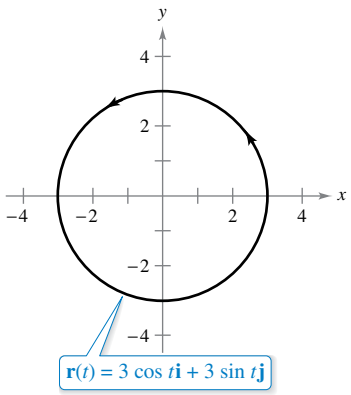

Figure 15.17

The orientation of C affects the value of the differential form of a line integral. Specifically, if $-C$ has the orientation opposite to that of C, then

$$\int_{-C} M\,dx + N\,dy = -\int_C M\,dx + N\,dy.$$

So, of the three line integral forms presented in this section, the orientation of C does not affect the form $\int_C f(x, y)\,ds$, but it does affect the vector form and the differential form.

GO DIGITAL

For curves represented by $y = g(x)$, $a \le x \le b$, you can let $x = t$ and obtain the parametric form

$$x = t \quad \text{and} \quad y = g(t), \quad a \le t \le b.$$

Because $dx = dt$ for this form, you have the option of evaluating the line integral in the variable x or the variable t. This is demonstrated in Example 9.

EXAMPLE 9 Evaluating a Line Integral in Differential Form

Evaluate

$$\int_C y\,dx + x^2\,dy$$

where C is the parabolic arc given by $y = 4x - x^2$ from $(4, 0)$ to $(1, 3)$, as shown in Figure 15.18.

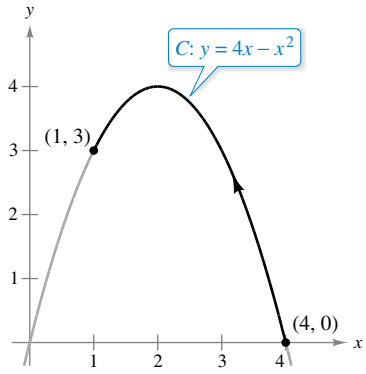

Figure 15.18

Solution Rather than converting to the parameter t, you can simply retain the variable x and write

$$y = 4x - x^2 \quad \Rightarrow \quad dy = (4 - 2x)\,dx.$$

Then, in the direction from $(4, 0)$ to $(1, 3)$, the line integral is

$$\begin{aligned}\int_C y\,dx + x^2\,dy &= \int_4^1 [(4x - x^2)\,dx + x^2(4 - 2x)\,dx] \\ &= \int_4^1 (4x + 3x^2 - 2x^3)\,dx \\ &= \left[2x^2 + x^3 - \frac{x^4}{2}\right]_4^1 \\ &= \frac{69}{2}.\end{aligned}$$

See Example 7.

Exploration

Finding Lateral Surface Area The figure below shows a piece of tin that has been cut from a circular cylinder. The base of the circular cylinder is modeled by $x^2 + y^2 = 9$. At any point (x, y) on the base, the height of the object is

$$f(x, y) = 1 + \cos\frac{\pi x}{4}.$$

Explain how to use a line integral to find the surface area of the piece of tin.

15.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. State the physical interpretation of each line integral.

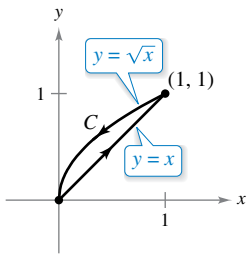
(a) $\int_C 1\, ds$

(b) $\int_C f(x, y, z)\, ds$, where $f(x, y, z)$ is the density of a string of finite length

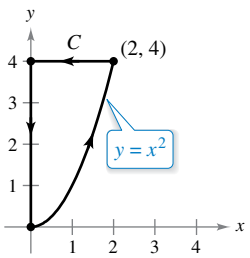
2. Describe how reversing the orientation of a curve C affects $\int_C \mathbf{F} \cdot d\mathbf{r}$.

Finding a Piecewise Smooth Parametrization **In Exercises 3–8, find a piecewise smooth parametrization of the path C. (There is more than one correct answer.)**

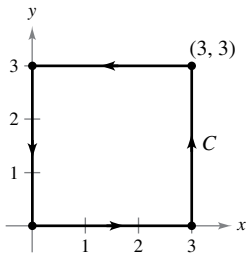
3.



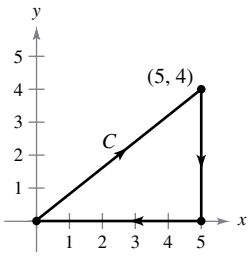
4.



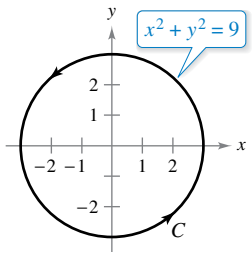
5.



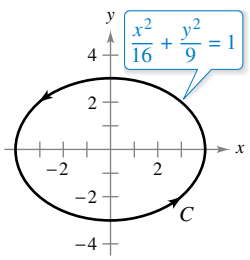
6.



7.



8.



Evaluating a Line Integral **In Exercises 9–12, (a) find a parametrization of the path C and (b) evaluate $\int_C (x^2 + y^2)\, ds$.**

9. C: line segment from $(0, 0)$ to $(1, 1)$

10. C: line segment from $(0, 0)$ to $(2, 4)$

11. C: counterclockwise around the circle $x^2 + y^2 = 1$ from $(1, 0)$ to $(0, 1)$

12. C: counterclockwise around the circle $x^2 + y^2 = 4$ from $(2, 0)$ to $(-2, 0)$

Evaluating a Line Integral **In Exercises 13–16, (a) find a piecewise smooth parametrization of the path C and (b) evaluate**

$$\int_C \left(2x + 3\sqrt{y}\right) ds.$$

13. C: line segments from $(0, 0)$ to $(1, 0)$ and $(1, 0)$ to $(2, 4)$

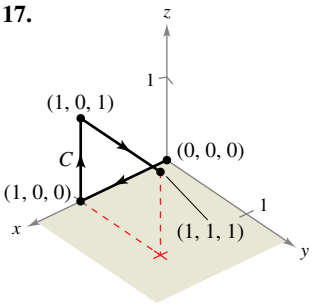
14. C: line segments from $(0, 1)$ to $(0, 4)$ and $(0, 4)$ to $(3, 3)$

15. C: counterclockwise around the triangle with vertices $(0, 0)$, $(1, 0)$, and $(0, 1)$

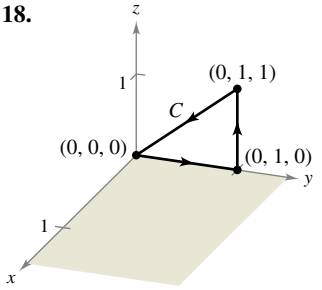
16. C: counterclockwise around the square with vertices $(0, 0)$, $(2, 0)$, $(2, 2)$, and $(0, 2)$

Evaluating a Line Integral **In Exercises 17 and 18, (a) find a piecewise smooth parametrization of the path C shown in the figure and (b) evaluate $\int_C (2x + y^2 - z)\, ds$.**

17.



18.



Evaluating a Line Integral **In Exercises 19–22, evaluate the line integral along the given path.**

19. $\int_C xy\, ds$

C: $\mathbf{r}(t) = 4t\mathbf{i} + 3t\mathbf{j}$

$0 \le t \le 1$

20. $\int_C 3(x - y)\, ds$

C: $\mathbf{r}(t) = t\mathbf{i} + (2 - t)\mathbf{j}$

$0 \le t \le 2$

21. $\int_C (x^2 + y^2 + z^2)\, ds$

C: $\mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + 2\mathbf{k}$

$0 \le t \le \dfrac{\pi}{2}$

22. $\int_C 2xyz\, ds$

C: $\mathbf{r}(t) = 12t\mathbf{i} + 5t\mathbf{j} + 84t\mathbf{k}$

$0 \le t \le 1$

Mass **In Exercises 23 and 24, find the total mass of a spring with density ρ in the shape of the circular helix**

$$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k},\ 0 \le t \le 4\pi.$$

23. $\rho(x, y, z) = \frac{1}{2}(x^2 + y^2 + z^2)$

24. $\rho(x, y, z) = z$

Mass **In Exercises 25–28, find the total mass of the wire with density ρ whose shape is modeled by r.**

25. $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j},\ 0 \le t \le \pi,\ \rho(x, y) = x + y + 2$

26. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{j},\ 0 \le t \le 1,\ \rho(x, y) = \frac{3}{4}y$

27. $\mathbf{r}(t) = t^2\mathbf{i} + 2t\mathbf{j} + t\mathbf{k},\ 1 \le t \le 3,$
$\rho(x, y, z) = kz\ (k > 0)$

28. $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + 3t\mathbf{k},\ 0 \le t \le 2\pi,$
$\rho(x, y, z) = k + z\ (k > 0)$

Evaluating a Line Integral of a Vector Field **In Exercises 29–34, evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$.**

29. $\mathbf{F}(x, y) = x\mathbf{i} + y\mathbf{j}$

C: $\mathbf{r}(t) = (3t + 1)\mathbf{i} + t\mathbf{j},\quad 0 \le t \le 1$

30. $\mathbf{F}(x, y) = xy\mathbf{i} + y\mathbf{j}$

C: $\mathbf{r}(t) = 4\cos t\mathbf{i} + 4\sin t\mathbf{j},\quad 0 \le t \le \dfrac{\pi}{2}$

31. $\mathbf{F}(x, y) = x^2\mathbf{i} + 4y\mathbf{j}$

C: $\mathbf{r}(t) = e^t\mathbf{i} + t^2\mathbf{j},\quad 0 \le t \le 2$

32. $\mathbf{F}(x, y) = 3x\mathbf{i} + 4y\mathbf{j}$

C: $\mathbf{r}(t) = t\mathbf{i} + \sqrt{4 - t^2}\mathbf{j},\quad -2 \le t \le 2$

33. $\mathbf{F}(x, y, z) = xy\mathbf{i} + xz\mathbf{j} + yz\mathbf{k}$

C: $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + 2t\mathbf{k},\quad 0 \le t \le 1$

34. $\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$

C: $\mathbf{r}(t) = 2\sin t\mathbf{i} + 2\cos t\mathbf{j} + \frac{1}{2}t^2\mathbf{k},\quad 0 \le t \le \pi$

Evaluating a Line Integral of a Vector Field Using Technology **In Exercises 35 and 36, use a graphing utility to evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$.**

35. $\mathbf{F}(x, y, z) = x^2z\mathbf{i} + 6y\mathbf{j} + yz^2\mathbf{k}$

C: $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \ln t\mathbf{k},\quad 1 \le t \le 3$

36. $\mathbf{F}(x, y, z) = \dfrac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$

C: $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + e^t\mathbf{k},\quad 0 \le t \le 2$

Work **In Exercises 37–42, find the work done by the force field F on a particle moving along the given path.**

37. $\mathbf{F}(x, y) = x\mathbf{i} + 2y\mathbf{j}$

C: $x = t, y = t^3$ from $(0, 0)$ to $(2, 8)$

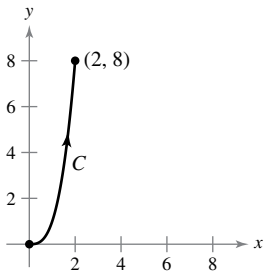

Figure for 37

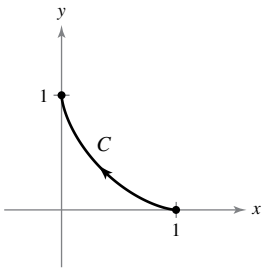

Figure for 38

38. $\mathbf{F}(x, y) = x^2\mathbf{i} - xy\mathbf{j}$

C: $x = \cos^3 t, y = \sin^3 t$ from $(1, 0)$ to $(0, 1)$

39. $\mathbf{F}(x, y) = x\mathbf{i} + y\mathbf{j}$

C: counterclockwise around the triangle with vertices $(0, 0)$, $(1, 0)$, and $(0, 1)$

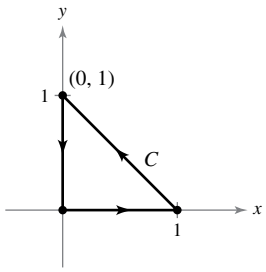

Figure for 39

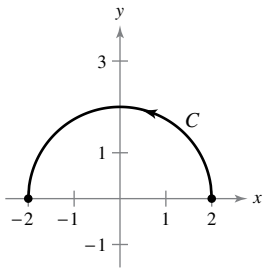

Figure for 40

40. $\mathbf{F}(x, y) = -y\mathbf{i} - x\mathbf{j}$

C: counterclockwise around the semicircle $y = \sqrt{4 - x^2}$ from $(2, 0)$ to $(-2, 0)$

41. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} - 5z\mathbf{k}$

C: $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k},\quad 0 \le t \le 2\pi$

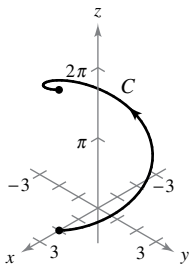

Figure for 41

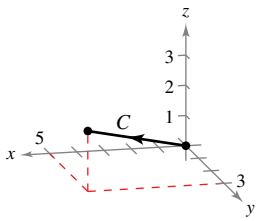

Figure for 42

42. $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$

C: line from $(0, 0, 0)$ to $(5, 3, 2)$

Work **In Exercises 43–46, determine whether the work done along the path C is positive, negative, or zero. Explain.**

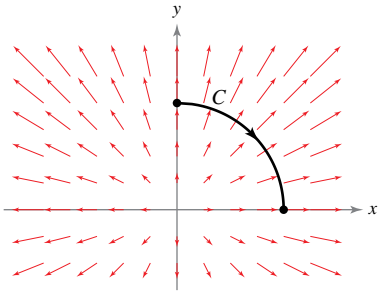
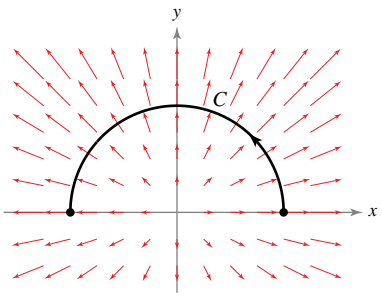
45.



46.



Evaluating a Line Integral of a Vector Field

In Exercises 47 and 48, evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$ for each curve. Discuss the orientation of the curve and its effect on the value of the integral.

47. $\mathbf{F}(x, y) = x^2\mathbf{i} + xy\mathbf{j}$

(a) C_1: $\mathbf{r}_1(t) = 2t\mathbf{i} + (t - 1)\mathbf{j}, \quad 1 \le t \le 3$

(b) C_2: $\mathbf{r}_2(t) = 2(3 - t)\mathbf{i} + (2 - t)\mathbf{j}, \quad 0 \le t \le 2$

48. $\mathbf{F}(x, y) = x^2y\mathbf{i} + xy^{3/2}\mathbf{j}$

(a) C_1: $\mathbf{r}_1(t) = (t + 1)\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 2$

(b) C_2: $\mathbf{r}_2(t) = (1 + 2\cos t)\mathbf{i} + (4\cos^2 t)\mathbf{j}, \quad 0 \le t \le \pi/2$

Demonstrating a Property

In Exercises 49–52, demonstrate the property that $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$ regardless of the initial and terminal points of C, where the tangent vector $\mathbf{r}'(t)$ is orthogonal to the force field $\mathbf{F}$.

49. $\mathbf{F}(x, y) = y\mathbf{i} - x\mathbf{j}$

C: $\mathbf{r}(t) = t\mathbf{i} - 2t\mathbf{j}$

50. $\mathbf{F}(x, y) = -3y\mathbf{i} + x\mathbf{j}$

C: $\mathbf{r}(t) = t\mathbf{i} - t^3\mathbf{j}$

51. $\mathbf{F}(x, y) = (x^3 - 2x^2)\mathbf{i} + \left(x - \frac{y}{2}\right)\mathbf{j}$

C: $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$

52. $\mathbf{F}(x, y) = x\mathbf{i} + y\mathbf{j}$

C: $\mathbf{r}(t) = 3\sin t\mathbf{i} + 3\cos t\mathbf{j}$

Evaluating a Line Integral in Differential Form

In Exercises 53–56, evaluate the line integral along the path C given by $x = 2t$, $y = 4t$, where $0 \le t \le 1$.

53. $\displaystyle\int_C (x + 3y^2)\, dy$

54. $\displaystyle\int_C (x^3 + 2y)\, dx$

55. $\displaystyle\int_C xy\, dx + y\, dy$

56. $\displaystyle\int_C (y - x)\, dx + 5x^2y^2\, dy$

Evaluating a Line Integral in Differential Form

In Exercises 57–64, evaluate

$$\int_C (2x - y)\, dx + (x + 3y)\, dy.$$

57. C: x-axis from $x = 0$ to $x = 5$

58. C: y-axis from $y = 0$ to $y = 2$

59. C: line segments from $(0, 0)$ to $(3, 0)$ and $(3, 0)$ to $(3, 3)$

60. C: line segments from $(0, 0)$ to $(0, -3)$ and $(0, -3)$ to $(2, -3)$

61. C: arc on $y = 1 - x^2$ from $(0, 1)$ to $(1, 0)$

62. C: arc on $y = x^{3/2}$ from $(0, 0)$ to $(4, 8)$

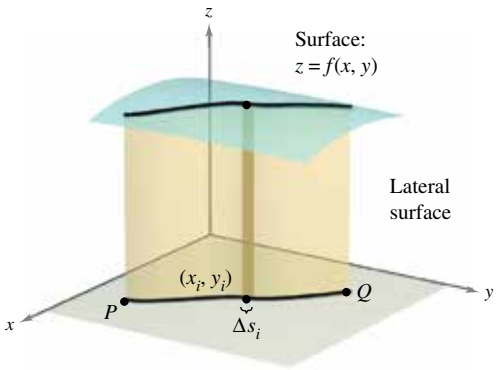
63. C: parabolic path $x = t$, $y = 2t^2$ from $(0, 0)$ to $(2, 8)$

64. C: elliptic path $x = 4\sin t$, $y = 3\cos t$ from $(0, 3)$ to $(4, 0)$

Lateral Surface Area

In Exercises 65–72, find the area of the lateral surface (see figure) over the curve C in the xy-plane and under the surface $z = f(x, y)$, where

$$\text{Lateral surface area} = \int_C f(x, y)\, ds.$$



C: Curve in xy-plane

65. $f(x, y) = h$, C: line from $(0, 0)$ to $(3, 4)$

66. $f(x, y) = y$, C: line from $(0, 0)$ to $(4, 4)$

67. $f(x, y) = xy$, C: $x^2 + y^2 = 1$ from $(1, 0)$ to $(0, 1)$

68. $f(x, y) = x + y$, C: $x^2 + y^2 = 1$ from $(1, 0)$ to $(0, 1)$

69. $f(x, y) = h$, C: $y = 1 - x^2$ from $(1, 0)$ to $(0, 1)$

70. $f(x, y) = y + 1$, C: $y = 1 - x^2$ from $(1, 0)$ to $(0, 1)$

71. $f(x, y) = xy$, C: $y = 1 - x^2$ from $(1, 0)$ to $(0, 1)$

72. $f(x, y) = x^2 - y^2 + 4$, C: $x^2 + y^2 = 4$

73. Engine Design A tractor engine has a steel component with a circular base modeled by the vector-valued function

$$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j}.$$

Its height is given by $z = 1 + y^2$. (All measurements of the component are in centimeters.)

(a) Find the lateral surface area of the component.

(b) The component is in the form of a shell of thickness 0.2 centimeter. Use the result of part (a) to approximate the amount of steel used to manufacture the component.

(c) Draw a sketch of the component.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

74. Building Design

The ceiling of a building has a height above the floor given by $z = 20 + \frac{1}{4}x$. One of the walls follows a path modeled by $y = x^{3/2}$. Find the surface area of the wall for $0 \le x \le 40$. (All measurements are in feet.)

Moments of Inertia **Consider a wire of density $\rho(x, y)$ given by the space curve**

$$C\text{: } \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}, \quad 0 \le t \le b.$$

The moments of inertia about the x- and y-axes are given by

$$I_x = \int_C y^2\rho(x, y)\,ds \quad \text{and} \quad I_y = \int_C x^2\rho(x, y)\,ds.$$

In Exercises 75 and 76, find the moments of inertia for the wire of density ρ.

75. A wire lies along $\mathbf{r}(t) = a\cos t\mathbf{i} + a\sin t\mathbf{j}$, where $0 \le t \le 2\pi$ and $a > 0$, with density $\rho(x, y) = 1$.

76. A wire lies along $\mathbf{r}(t) = a\cos t\mathbf{i} + a\sin t\mathbf{j}$, where $0 \le t \le 2\pi$ and $a > 0$, with density $\rho(x, y) = y$.

77. Investigation The top outer edge of a solid with vertical sides that is resting on the xy-plane is modeled by $\mathbf{r}(t) = 3\cos t\mathbf{i} + 3\sin t\mathbf{j} + (1 + \sin^2 2t)\mathbf{k}$, where all measurements are in centimeters. The intersection of the plane $y = b$, where $-3 < b < 3$, with the top of the solid is a horizontal line.

(a) Use a graphing utility to graph the solid.

(b) Use a graphing utility to approximate the lateral surface area of the solid.

(c) Find (if possible) the volume of the solid.

78. Work A particle moves along the path $y = x^2$ from the point $(0, 0)$ to the point $(1, 1)$. The force field $\mathbf{F}$ is measured at five points along the path, and the results are shown in the table. Use Simpson's Rule or a graphing utility to approximate the work done by the force field.

(x, y)	$(0, 0)$	$\left(\frac{1}{4}, \frac{1}{16}\right)$	$\left(\frac{1}{2}, \frac{1}{4}\right)$	$\left(\frac{3}{4}, \frac{9}{16}\right)$	$(1, 1)$
$\mathbf{F}(x, y)$	$\langle 5, 0\rangle$	$\langle 3.5, 1\rangle$	$\langle 2, 2\rangle$	$\langle 1.5, 3\rangle$	$\langle 1, 5\rangle$

79. Work Find the work done by a person weighing 175 pounds walking exactly one revolution up a circular helical staircase of radius 3 feet when the person rises 10 feet.

80. Investigation Determine the value of c such that the work done by the force field $\mathbf{F}(x, y) = 15[(4 - x^2y)\mathbf{i} - xy\mathbf{j}]$ on an object moving along the parabolic path $y = c(1 - x^2)$ between the points $(-1, 0)$ and $(1, 0)$ is a minimum. Compare the result with the work required to move the object along the straight-line path connecting the points.

Exploring Concepts

81. A path C is given by $x = t$, $y = 2t$, where $0 \le t \le 1$. Are $\int_C (x + y)\,dx$ and $\int_C (x + y)\,dy$ equivalent? Explain.

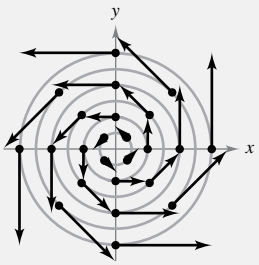
82. Let $\mathbf{F}(x, y) = 2x\mathbf{i} + xy^2\mathbf{j}$ and consider the curve $y = x^2$ from $(0, 0)$ to $(2, 4)$ in the xy-plane. Set up and evaluate line integrals of the forms $\int_C \mathbf{F} \cdot d\mathbf{r}$ and $\int_C M\,dx + N\,dy$. Compare your results. Which method do you prefer? Explain.

83. Order the surfaces in ascending order of the lateral surface area under the surface and over the curve $y = \sqrt{x}$ from $(0, 0)$ to $(4, 2)$ in the xy-plane. Explain your ordering without doing any calculations.

(a) $z_1 = 2 + x$ (b) $z_2 = 5 + x$

(c) $z_3 = 2$ (d) $z_4 = 10 + x + 2y$

84. HOW DO YOU SEE IT? For each of the following, determine whether the work done in moving an object from the first to the second point through the force field shown in the figure is positive, negative, or zero. Explain your answer. (In the figure, the circles have radii 1, 2, 3, 4, 5, and 6.)



(a) From $(-3, -3)$ to $(3, 3)$

(b) From $(-3, 0)$ to $(0, 3)$

(c) From $(5, 0)$ to $(0, 3)$

True or False? **In Exercises 85 and 86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

85. If C is given by $x = t$, $y = t$, where $0 \le t \le 1$, then

$$\int_C xy\,ds = \int_0^1 t^2\,dt.$$

86. If $C_2 = -C_1$, then $\int_{C_1} f(x, y)\,ds + \int_{C_2} f(x, y)\,ds = 0$.

87. Work Consider a particle that moves through the force field

$$\mathbf{F}(x, y) = (y - x)\mathbf{i} + xy\mathbf{j}$$

from the point $(0, 0)$ to the point $(0, 1)$ along the curve $x = kt(1 - t)$, $y = t$. Find the value of k such that the work done by the force field is 1.

15.3 Conservative Vector Fields and Independence of Path

GO DIGITAL

- Define the Fundamental Theorem of Line Integrals.
- Describe the concept of independence of path.
- Describe the concept of conservation of energy.

Fundamental Theorem of Line Integrals

The discussion at the beginning of Section 15.2 pointed out that in a gravitational field, the work done by gravity on an object moving between two points in the field is independent of the path taken by the object. In this section, you will study an important generalization of this result—it is called the **Fundamental Theorem of Line Integrals.** To begin, an example is presented in which the line integral of a *conservative vector field* is evaluated over three different paths.

EXAMPLE 1 **Line Integral of a Conservative Vector Field**

Find the work done by the force field

$$\mathbf{F}(x, y) = \frac{1}{2}xy\mathbf{i} + \frac{1}{4}x^2\mathbf{j}$$

on a particle that moves from $(0, 0)$ to $(1, 1)$ along each path, as shown in Figure 15.19.

a. C_1: $y = x$ **b.** C_2: $x = y^2$ **c.** C_3: $y = x^3$

Solution Note that $\mathbf{F}$ is conservative because the first partial derivatives are equal.

$$\frac{\partial}{\partial y}\left[\frac{1}{2}xy\right] = \frac{1}{2}x \quad \text{and} \quad \frac{\partial}{\partial x}\left[\frac{1}{4}x^2\right] = \frac{1}{2}x$$

a. Let $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}$ for $0 \le t \le 1$, so that

$$d\mathbf{r} = (\mathbf{i} + \mathbf{j})\,dt \quad \text{and} \quad \mathbf{F}(x, y) = \frac{1}{2}t^2\mathbf{i} + \frac{1}{4}t^2\mathbf{j}.$$

Then the work done is

$$W = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_0^1 \frac{3}{4}t^2\,dt = \frac{1}{4}t^3\Big]_0^1 = \frac{1}{4}.$$

b. Let $\mathbf{r}(t) = t\mathbf{i} + \sqrt{t}\mathbf{j}$ for $0 \le t \le 1$, so that

$$d\mathbf{r} = \left(\mathbf{i} + \frac{1}{2\sqrt{t}}\mathbf{j}\right)dt \quad \text{and} \quad \mathbf{F}(x, y) = \frac{1}{2}t^{3/2}\mathbf{i} + \frac{1}{4}t^2\mathbf{j}.$$

Then the work done is

$$W = \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_0^1 \frac{5}{8}t^{3/2}\,dt = \frac{1}{4}t^{5/2}\Big]_0^1 = \frac{1}{4}.$$

c. Let $\mathbf{r}(t) = \frac{1}{2}t\mathbf{i} + \frac{1}{8}t^3\mathbf{j}$ for $0 \le t \le 2$, so that

$$d\mathbf{r} = \left(\frac{1}{2}\mathbf{i} + \frac{3}{8}t^2\mathbf{j}\right)dt \quad \text{and} \quad \mathbf{F}(x, y) = \frac{1}{32}t^4\mathbf{i} + \frac{1}{16}t^2\mathbf{j}.$$

Then the work done is

$$W = \int_{C_3} \mathbf{F} \cdot d\mathbf{r} = \int_0^2 \frac{5}{128}t^4\,dt = \frac{1}{128}t^5\Big]_0^2 = \frac{1}{4}.$$

So, the work done by the conservative vector field $\mathbf{F}$ is the same for each path. ■

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

In Example 1, note that the vector field $\mathbf{F}(x, y) = \frac{1}{2}xy\mathbf{i} + \frac{1}{4}x^2\mathbf{j}$ is conservative because $\mathbf{F}(x, y) = \nabla f(x, y)$, where $f(x, y) = \frac{1}{4}x^2y$. In such cases, the next theorem states that the value of $\int_C \mathbf{F} \cdot d\mathbf{r}$ is given by

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= f(x(1), y(1)) - f(x(0), y(0)) \\ &= \frac{1}{4} - 0 \\ &= \frac{1}{4}.\end{aligned}$$

REMARK Notice how the Fundamental Theorem of Line Integrals is similar to the Fundamental Theorem of Calculus (see Section 4.4), which states that

$$\int_a^b f(x)\,dx = F(b) - F(a)$$

where $F'(x) = f(x)$.

THEOREM 15.5 Fundamental Theorem of Line Integrals

Let C be a piecewise smooth curve lying in an open region R and given by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}, \quad a \le t \le b.$$

If $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$ is conservative in R, and M and N are continuous in R, then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = f(x(b), y(b)) - f(x(a), y(a))$$

where f is a potential function of $\mathbf{F}$. That is, $\mathbf{F}(x, y) = \nabla f(x, y)$.

Proof A proof is provided only for a smooth curve. For piecewise smooth curves, the procedure is carried out separately on each smooth portion. Because

$$\mathbf{F}(x, y) = \nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}$$

it follows that

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= \int_a^b \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\,dt \\ &= \int_a^b \left[f_x(x, y)\frac{dx}{dt} + f_y(x, y)\frac{dy}{dt}\right] dt\end{aligned}$$

and, by the Chain Rule (see Theorem 13.6 in Section 13.5), you have

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= \int_a^b \frac{d}{dt}[f(x(t), y(t))]\,dt \\ &= f(x(b), y(b)) - f(x(a), y(a)).\end{aligned}$$

The last step is an application of the Fundamental Theorem of Calculus. ■

In space, the Fundamental Theorem of Line Integrals takes the following form. Let C be a piecewise smooth curve lying in an open region Q and given by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}, \quad a \le t \le b.$$

If $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is conservative, and M, N, and P are continuous, then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = f(x(b), y(b), z(b)) - f(x(a), y(a), z(a))$$

where $\mathbf{F}(x, y, z) = \nabla f(x, y, z)$.

The Fundamental Theorem of Line Integrals states that if the vector field $\mathbf{F}$ is conservative, then the line integral between any two points is simply the difference in the values of the *potential* function f at these points.

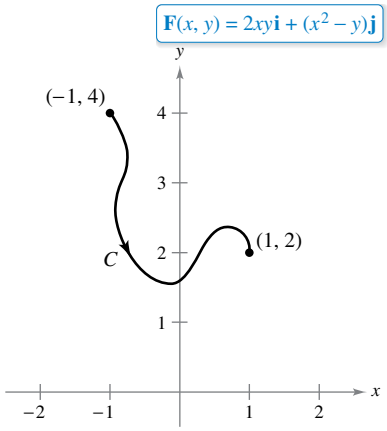

Figure 15.20

EXAMPLE 2 Using the Fundamental Theorem of Line Integrals

Evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$, where C is a piecewise smooth curve from $(-1, 4)$ to $(1, 2)$ and

$$\mathbf{F}(x, y) = 2xy\mathbf{i} + (x^2 - y)\mathbf{j}$$

as shown in Figure 15.20.

Solution From Example 6 in Section 15.1, you know that $\mathbf{F}$ is the gradient of f, where

$$f(x, y) = x^2y - \frac{y^2}{2} + K.$$

Consequently, $\mathbf{F}$ is conservative, and by the Fundamental Theorem of Line Integrals, it follows that

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= f(1, 2) - f(-1, 4) \\ &= \left[1^2(2) - \frac{2^2}{2}\right] - \left[(-1)^2(4) - \frac{4^2}{2}\right] \\ &= 4.\end{aligned}$$

Note that it is unnecessary to include a constant K as part of f, because it is canceled by subtraction.

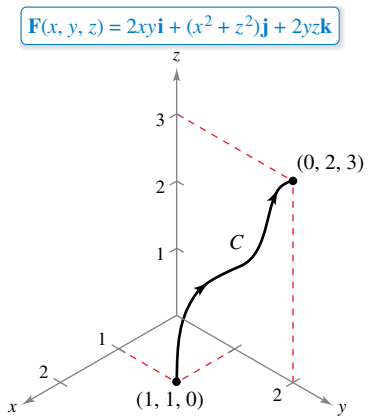

Figure 15.21

EXAMPLE 3 Using the Fundamental Theorem of Line Integrals

Evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$, where C is a piecewise smooth curve from $(1, 1, 0)$ to $(0, 2, 3)$ and

$$\mathbf{F}(x, y, z) = 2xy\mathbf{i} + (x^2 + z^2)\mathbf{j} + 2yz\mathbf{k}$$

as shown in Figure 15.21.

Solution From Example 8 in Section 15.1, you know that $\mathbf{F}$ is the gradient of f, where

$$f(x, y, z) = x^2y + yz^2 + K.$$

Consequently, $\mathbf{F}$ is conservative, and by the Fundamental Theorem of Line Integrals, it follows that

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= f(0, 2, 3) - f(1, 1, 0) \\ &= [(0)^2(2) + (2)(3)^2] - [(1)^2(1) + (1)(0)^2] \\ &= 17.\end{aligned}$$

In Examples 2 and 3, be sure you see that the value of the line integral is the same for any smooth curve C that has the given initial and terminal points. For instance, in Example 3, evaluate the line integral for the curve given by

$$\mathbf{r}(t) = (1 - t)\mathbf{i} + (1 + t)\mathbf{j} + 3t\mathbf{k}.$$

You should obtain

$$\begin{aligned}\int_C \mathbf{F} \cdot d\mathbf{r} &= \int_0^1 (30t^2 + 16t - 1)\, dt \\ &= 17.\end{aligned}$$

R_1 is connected. R_2 is not connected.

Figure 15.22

Independence of Path

From the Fundamental Theorem of Line Integrals, it is clear that if $\mathbf{F}$ is continuous and conservative in an open region R, then the value of $\int_C \mathbf{F} \cdot d\mathbf{r}$ is the same for every piecewise smooth curve C from one fixed point in R to another fixed point in R. This result is described by saying that the line integral $\int_C \mathbf{F} \cdot d\mathbf{r}$ is **independent of path** in the region R.

A region in the plane (or in space) is **connected** when any two points in the region can be joined by a piecewise smooth curve lying entirely within the region, as shown in Figure 15.22. In open regions that are *connected,* the path independence of $\int_C \mathbf{F} \cdot d\mathbf{r}$ is equivalent to the condition that $\mathbf{F}$ is conservative.

THEOREM 15.6 Independence of Path and Conservative Vector Fields

If $\mathbf{F}$ is continuous on an open connected region, then the line integral

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

is independent of path if and only if $\mathbf{F}$ is conservative.

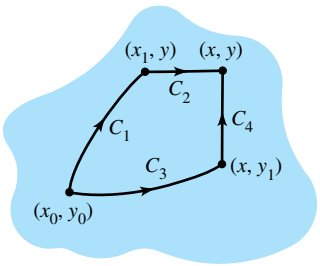

Figure 15.23

Proof If $\mathbf{F}$ is conservative, then, by the Fundamental Theorem of Line Integrals, the line integral is independent of path. Now establish the converse for a plane region R. Let $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$, and let (x_0, y_0) be a fixed point in R. For any point (x, y) in R, choose a piecewise smooth curve C running from (x_0, y_0) to (x, y), and define f by

$$\begin{aligned} f(x, y) &= \int_C \mathbf{F} \cdot d\mathbf{r} \\ &= \int_C M\,dx + N\,dy. \end{aligned}$$

The existence of C in R is guaranteed by the fact that R is connected. You can show that f is a potential function of $\mathbf{F}$ by considering two different paths between (x_0, y_0) and (x, y). For the *first* path, choose (x_1, y) in R such that $x \neq x_1$. This is possible because R is open. Then choose C_1 and C_2, as shown in Figure 15.23. Using the independence of path, it follows that

$$\begin{aligned} f(x, y) &= \int_C M\,dx + N\,dy \\ &= \int_{C_1} M\,dx + N\,dy + \int_{C_2} M\,dx + N\,dy. \end{aligned}$$

Because the first integral does not depend on x and because $dy = 0$ in the second integral, you have

$$f(x, y) = g(y) + \int_{C_2} M\,dx$$

and it follows that the partial derivative of f with respect to x is $f_x(x, y) = M$. For the *second* path, choose a point (x, y_1). Using reasoning similar to that used for the first path, you can conclude that $f_y(x, y) = N$. Therefore,

$$\begin{aligned} \nabla f(x, y) &= f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} \\ &= M\mathbf{i} + N\mathbf{j} \\ &= \mathbf{F}(x, y) \end{aligned}$$

and it follows that $\mathbf{F}$ is conservative. ∎

EXAMPLE 4 **Finding Work in a Conservative Force Field**

For the force field given by

$$\mathbf{F}(x, y, z) = e^x \cos y\mathbf{i} - e^x \sin y\mathbf{j} + 2\mathbf{k}$$

show that $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path, and calculate the work done by $\mathbf{F}$ on an object moving along a curve C from $(0, \pi/2, 1)$ to $(1, \pi, 3)$.

Solution Writing the force field in the form $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$, you have $M = e^x \cos y$, $N = -e^x \sin y$, and $P = 2$, and it follows that

$$\frac{\partial P}{\partial y} = 0 = \frac{\partial N}{\partial z}$$
$$\frac{\partial P}{\partial x} = 0 = \frac{\partial M}{\partial z}$$

and

$$\frac{\partial N}{\partial x} = -e^x \sin y = \frac{\partial M}{\partial y}.$$

So, $\mathbf{F}$ is conservative. If f is a potential function of $\mathbf{F}$, then

$$f_x(x, y, z) = e^x \cos y$$
$$f_y(x, y, z) = -e^x \sin y$$

and

$$f_z(x, y, z) = 2.$$

By integrating with respect to x, y, and z separately, you obtain

$$f(x, y, z) = \int f_x(x, y, z)\, dx = \int e^x \cos y\, dx = e^x \cos y + g(y, z)$$
$$f(x, y, z) = \int f_y(x, y, z)\, dy = \int -e^x \sin y\, dy = e^x \cos y + h(x, z)$$

and

$$f(x, y, z) = \int f_z(x, y, z)\, dz = \int 2\, dz = 2z + k(x, y).$$

By comparing these three versions of $f(x, y, z)$, you can conclude that

$$f(x, y, z) = e^x \cos y + 2z + K.$$

Therefore, the work done by $\mathbf{F}$ along *any* curve C from $(0, \pi/2, 1)$ to $(1, \pi, 3)$ is

$$\begin{aligned} W &= \int_C \mathbf{F} \cdot d\mathbf{r} \\ &= f(1, \pi, 3) - f\left(0, \frac{\pi}{2}, 1\right) \\ &= (-e + 6) - (0 + 2) \\ &= 4 - e. \end{aligned}$$

For the object in Example 4, how much work is done when the object moves on a curve from $(0, \pi/2, 1)$ to $(1, \pi, 3)$ and then back to the starting point $(0, \pi/2, 1)$? The Fundamental Theorem of Line Integrals states that there is zero work done. Remember that, by definition, work can be negative. So, by the time the object gets back to its starting point, the amount of work that registers positively is canceled out by the amount of work that registers negatively.

GO DIGITAL

A curve C given by $\mathbf{r}(t)$ for $a \le t \le b$ is **closed** when $\mathbf{r}(a) = \mathbf{r}(b)$. By the Fundamental Theorem of Line Integrals, you can conclude that if $\mathbf{F}$ is continuous and conservative on an open region R, then the line integral over every closed curve C is 0.

REMARK Theorem 15.7 gives you options for evaluating a line integral involving a conservative vector field. You can use a potential function, or it might be more convenient to choose a particularly simple path, such as a straight line.

THEOREM 15.7 Equivalent Conditions

Let $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ have continuous first partial derivatives in an open connected region R, and let C be a piecewise smooth curve in R. The conditions listed below are equivalent.

1. $\mathbf{F}$ is conservative. That is, $\mathbf{F} = \nabla f$ for some function f.
2. $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path.
3. $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$ for every *closed* curve C in R.

EXAMPLE 5 Evaluating a Line Integral

See LarsonCalculus.com for an interactive version of this type of example.

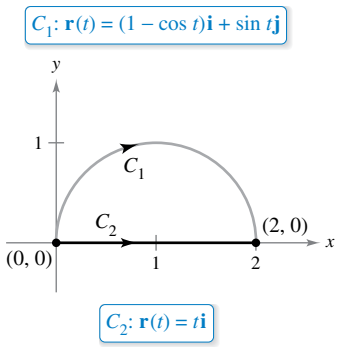

Figure 15.24

Evaluate $\int_{C_1} \mathbf{F} \cdot d\mathbf{r}$, where

$$\mathbf{F}(x, y) = (y^3 + 1)\mathbf{i} + (3xy^2 + 1)\mathbf{j}$$

and C_1 is the semicircular path from $(0, 0)$ to $(2, 0)$, as shown in Figure 15.24.

Solution You have the following three options.

a. You can use the method presented in Section 15.2 to evaluate the line integral along the *given curve.* To do this, you can use the parametrization $\mathbf{r}(t) = (1 - \cos t)\mathbf{i} + \sin t\mathbf{j}$, where $0 \le t \le \pi$. For this parametrization, it follows that

$$d\mathbf{r} = \mathbf{r}'(t)\,dt = (\sin t\mathbf{i} + \cos t\mathbf{j})\,dt$$

and

$$\int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_0^{\pi} (\sin t + \sin^4 t + \cos t + 3\sin^2 t \cos t - 3\sin^2 t \cos^2 t)\,dt.$$

This integral should discourage you from using this option.

b. You can try to find a *potential function* and evaluate the line integral by the Fundamental Theorem of Line Integrals. Using the technique demonstrated in Example 4, you can find the potential function to be $f(x, y) = xy^3 + x + y + K$, and, by the Fundamental Theorem,

$$W = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} = f(2, 0) - f(0, 0) = 2.$$

c. Knowing that $\mathbf{F}$ is conservative, you have a third option. Because the value of the line integral is independent of path, you can replace the semicircular path with a *simpler path.* Choose the straight-line path C_2 from $(0, 0)$ to $(2, 0)$. Let $\mathbf{r}(t) = t\mathbf{i}$ for $0 \le t \le 2$, so that

$$d\mathbf{r} = \mathbf{i}\,dt \quad \text{and} \quad \mathbf{F}(x, y) = \mathbf{i} + \mathbf{j}.$$

Then the integral is

$$\int_{C_1} \mathbf{F} \cdot d\mathbf{r} = \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_0^2 1\,dt = t\Big]_0^2 = 2.$$

Of the three options, the third one is obviously the easiest. ■

Conservation of Energy

MICHAEL FARADAY (1791–1867)

Several philosophers of science have considered Faraday's Law of Conservation of Energy to be the greatest generalization ever conceived by humankind. Many physicists have contributed to our knowledge of this law. Two early and influential ones were James Prescott Joule (1818–1889) and Hermann Ludwig Helmholtz (1821–1894).

In 1840, the English physicist Michael Faraday wrote, "Nowhere is there a pure creation or production of power without a corresponding exhaustion of something to supply it." This statement represents the first formulation of one of the most important laws of physics—the **Law of Conservation of Energy.** In modern terminology, the law is stated as follows: *In a conservative force field, the sum of the potential and kinetic energies of an object remains constant from point to point.*

You can use the Fundamental Theorem of Line Integrals to derive this law. From physics, the **kinetic energy** of a particle of mass m and speed v is

$$k = \frac{1}{2}mv^2. \qquad \text{Kinetic energy}$$

The **potential energy** p of a particle at point (x, y, z) in a conservative vector field $\mathbf{F}$ is defined as $p(x, y, z) = -f(x, y, z)$, where f is the potential function for $\mathbf{F}$. Consequently, the work done by $\mathbf{F}$ along a smooth curve C from A to B is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = f(x, y, z)\Big]_A^B = -p(x, y, z)\Big]_A^B = p(A) - p(B)$$

as shown in Figure 15.25. In other words, work W is equal to the difference in the potential energies of A and B. Now, suppose that $\mathbf{r}(t)$ is the position vector for a particle moving along C from $A = \mathbf{r}(a)$ to $B = \mathbf{r}(b)$. At any time t, the particle's velocity, acceleration, and speed are $\mathbf{v}(t) = \mathbf{r}'(t)$, $\mathbf{a}(t) = \mathbf{r}''(t)$, and $v(t) = \|\mathbf{v}(t)\|$, respectively. So, by Newton's Second Law of Motion, $\mathbf{F} = m\mathbf{a}(t) = m(\mathbf{v}'(t))$, and the work done by $\mathbf{F}$ is

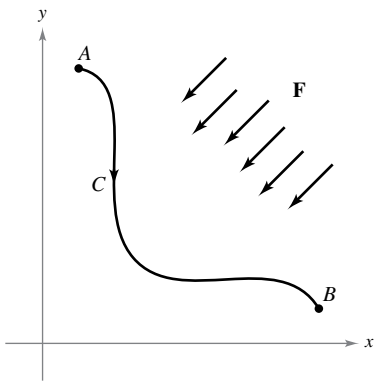
$$\begin{aligned}
W &= \int_C \mathbf{F} \cdot d\mathbf{r} \\
&= \int_a^b \mathbf{F} \cdot \mathbf{r}'(t)\, dt \\
&= \int_a^b \mathbf{F} \cdot \mathbf{v}(t)\, dt \\
&= \int_a^b [m\mathbf{v}'(t)] \cdot \mathbf{v}(t)\, dt \\
&= \int_a^b m[\mathbf{v}'(t) \cdot \mathbf{v}(t)]\, dt \\
&= \frac{m}{2}\int_a^b \frac{d}{dt}[\mathbf{v}(t) \cdot \mathbf{v}(t)]\, dt \\
&= \frac{m}{2}\int_a^b \frac{d}{dt}[\|\mathbf{v}(t)\|^2]\, dt \\
&= \frac{m}{2}\Big[\|\mathbf{v}(t)\|^2\Big]_a^b \\
&= \frac{m}{2}\Big[[v(t)]^2\Big]_a^b \\
&= \frac{1}{2}m[v(b)]^2 - \frac{1}{2}m[v(a)]^2 \\
&= k(B) - k(A).
\end{aligned}$$

Equating these two results for W produces

$$\begin{aligned}
p(A) - p(B) &= k(B) - k(A) \\
p(A) + k(A) &= p(B) + k(B)
\end{aligned}$$

which implies that the sum of the potential and kinetic energies remains constant from point to point.

GO DIGITAL



The work done by $\mathbf{F}$ along C is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = p(A) - p(B).$$

Concept Check

1. Explain how to evaluate a line integral using the Fundamental Theorem of Line Integrals.
2. Explain what it means for a line integral to be independent of path. State the method for determining whether a line integral is independent of path.

Line Integral of a Conservative Vector Field

In Exercises 3–8, (a) show that F is conservative and (b) verify that the value of

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

is the same for each parametric representation of C.

3. $\mathbf{F}(x, y) = x^2\mathbf{i} + y\mathbf{j}$
   (i) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 1$
   (ii) C_2: $\mathbf{r}_2(\theta) = \sin\theta\mathbf{i} + \sin^2\theta\mathbf{j}, \quad 0 \le \theta \le \pi/2$
4. $\mathbf{F}(x, y) = (x^2 - y^2)\mathbf{i} - 2xy\mathbf{j}$
   (i) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + \sqrt{t}\mathbf{j}, \quad 0 \le t \le 4$
   (ii) C_2: $\mathbf{r}_2(w) = w^2\mathbf{i} + w\mathbf{j}, \quad 0 \le w \le 2$
5. $\mathbf{F}(x, y) = 3y\mathbf{i} + 3x\mathbf{j}$
   (i) C_1: $\mathbf{r}_1(\theta) = \sec\theta\mathbf{i} + \tan\theta\mathbf{j}, \quad 0 \le \theta \le \pi/3$
   (ii) C_2: $\mathbf{r}_2(t) = \sqrt{t+1}\mathbf{i} + \sqrt{t}\mathbf{j}, \quad 0 \le t \le 3$
6. $\mathbf{F}(x, y) = y\mathbf{i} + x\mathbf{j}$
   (i) C_1: $\mathbf{r}_1(t) = (2 + t)\mathbf{i} + (3 - t)\mathbf{j}, \quad 0 \le t \le 1$
   (ii) C_2: $\mathbf{r}_2(w) = (2 + \ln w)\mathbf{i} + (3 - \ln w)\mathbf{j}, \quad 1 \le w \le e$
7. $\mathbf{F}(x, y, z) = y^2z\mathbf{i} + 2xyz\mathbf{j} + xy^2\mathbf{k}$
   (i) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + 2t\mathbf{j} + 4t\mathbf{k}, \quad 0 \le t \le 1$
   (ii) C_2: $\mathbf{r}_2(\theta) = \sin\theta\mathbf{i} + 2\sin\theta\mathbf{j} + 4\sin\theta\mathbf{k}, \quad 0 \le \theta \le \pi/2$
8. $\mathbf{F}(x, y, z) = 2yz\mathbf{i} + 2xz\mathbf{j} + 2xy\mathbf{k}$
   (i) C_1: $\mathbf{r}_1(t) = t\mathbf{i} - 4t\mathbf{j} + t^2\mathbf{k}, \quad 0 \le t \le 3$
   (ii) C_2: $\mathbf{r}_2(s) = s^2\mathbf{i} - \frac{4}{3}s^4\mathbf{j} + s^4\mathbf{k}, \quad 0 \le s \le \sqrt{3}$

Using the Fundamental Theorem of Line Integrals

In Exercises 9–18, evaluate

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

using the Fundamental Theorem of Line Integrals. Use a graphing utility to verify your results.

9. $\mathbf{F}(x, y) = 3y\mathbf{i} + 3x\mathbf{j}$
   C: smooth curve from $(0, 0)$ to $(3, 8)$
10. $\mathbf{F}(x, y) = 2(x + y)\mathbf{i} + 2(x + y)\mathbf{j}$
    C: smooth curve from $(-1, 1)$ to $(3, 2)$
11. $\mathbf{F}(x, y) = \cos x \sin y\mathbf{i} + \sin x \cos y\mathbf{j}$
    C: line segment from $(0, -\pi)$ to $\left(\frac{3\pi}{2}, \frac{\pi}{2}\right)$
12. $\mathbf{F}(x, y) = \frac{y}{x^2 + y^2}\mathbf{i} - \frac{x}{x^2 + y^2}\mathbf{j}$
    C: line segment from $(1, 1)$ to $\left(2\sqrt{3}, 2\right)$
13. $\mathbf{F}(x, y) = e^x \sin y\mathbf{i} + e^x \cos y\mathbf{j}$
    C: cycloid $x = \theta - \sin\theta, y = 1 - \cos\theta$ from $(0, 0)$ to $(2\pi, 0)$
14. $\mathbf{F}(x, y) = \frac{2x}{(x^2 + y^2)^2}\mathbf{i} + \frac{2y}{(x^2 + y^2)^2}\mathbf{j}$
    C: clockwise around the circle $(x - 4)^2 + (y - 5)^2 = 9$ from $(7, 5)$ to $(1, 5)$
15. $\mathbf{F}(x, y, z) = (z + 2y)\mathbf{i} + (2x - z)\mathbf{j} + (x - y)\mathbf{k}$
    (a) C_1: line segment from $(0, 0, 0)$ to $(1, 1, 1)$
    (b) C_2: line segments from $(0, 0, 0)$ to $(0, 0, 1)$ and $(0, 0, 1)$ to $(1, 1, 1)$
    (c) C_3: line segments from $(0, 0, 0)$ to $(1, 0, 0)$, from $(1, 0, 0)$ to $(1, 1, 0)$, and from $(1, 1, 0)$ to $(1, 1, 1)$
16. Repeat Exercise 15 using
    $\mathbf{F}(x, y, z) = zy\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$.
17. $\mathbf{F}(x, y, z) = -\sin x\mathbf{i} + z\mathbf{j} + y\mathbf{k}$
    C: smooth curve from $(0, 0, 0)$ to $\left(\frac{\pi}{2}, 3, 4\right)$
18. $\mathbf{F}(x, y, z) = 6x\mathbf{i} - 4z\mathbf{j} - (4y - 20z)\mathbf{k}$
    C: smooth curve from $(0, 0, 0)$ to $(3, 4, 0)$

Finding Work in a Conservative Force Field

In Exercises 19–22, (a) show that

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

is independent of path and (b) calculate the work done by the force field F on an object moving along a curve from P to Q.

19. $\mathbf{F}(x, y) = 9x^2y^2\mathbf{i} + (6x^3y - 1)\mathbf{j}$
    $P(0, 0), Q(5, 9)$
20. $\mathbf{F}(x, y) = \frac{2x}{y}\mathbf{i} - \frac{x^2}{y^2}\mathbf{j}$
    $P(-1, 1), Q(3, 2)$
21. $\mathbf{F}(x, y, z) = 3\mathbf{i} + 4y\mathbf{j} - \sin z\mathbf{k}$
    $P\left(0, 1, \frac{\pi}{2}\right), Q(1, 4, \pi)$
22. $\mathbf{F}(x, y, z) = 8x^3\mathbf{i} + z^2\cos 2y\mathbf{j} + z\sin 2y\mathbf{k}$
    $P\left(0, \frac{\pi}{4}, 1\right), Q(-2, 0, -1)$

Evaluating a Line Integral

In Exercises 23–32, evaluate

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

along each path. (*Hint:* If F is conservative, the integration may be easier on an alternative path.)

23. $\mathbf{F}(x, y) = 2xy\mathbf{i} + x^2\mathbf{j}$

(a) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 1$

(b) C_2: $\mathbf{r}_2(t) = t\mathbf{i} + t^3\mathbf{j}, \quad 0 \le t \le 1$

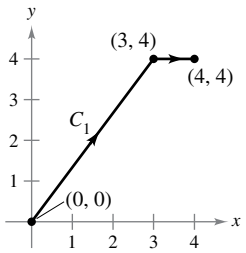
24. $\mathbf{F}(x, y) = ye^{xy}\mathbf{i} + xe^{xy}\mathbf{j}$

(a) C_1: $\mathbf{r}_1(t) = t\mathbf{i} - (t - 3)\mathbf{j}, \quad 0 \le t \le 3$

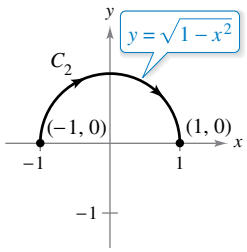
(b) C_2: The closed path consisting of line segments from $(0, 3)$ to $(0, 0)$, from $(0, 0)$ to $(3, 0)$, and then from $(3, 0)$ to $(0, 3)$

25. $\displaystyle\int_C y^2\,dx + 2xy\,dy$

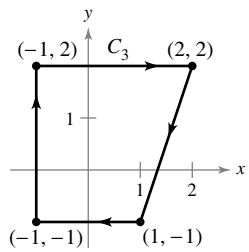
(a)



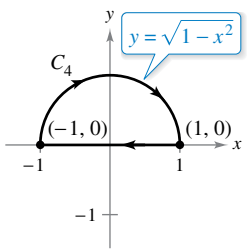
(b)



(c)

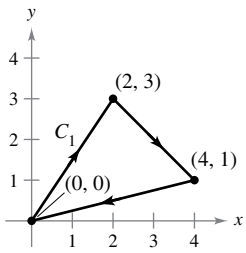


(d)

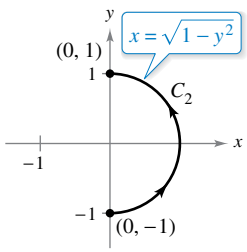


26. $\displaystyle\int_C (2x - 3y + 1)\,dx - (3x + y - 5)\,dy$

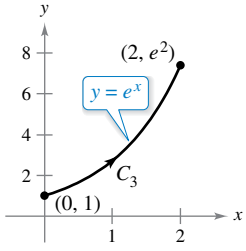
(a)



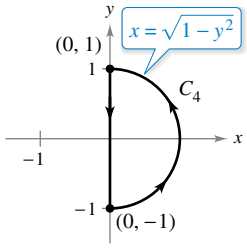
(b)



(c)



(d)



27. $\mathbf{F}(x, y, z) = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$

(a) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + 2\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 4$

(b) C_2: $\mathbf{r}_2(t) = t^2\mathbf{i} + t\mathbf{j} + t^2\mathbf{k}, \quad 0 \le t \le 2$

28. $\mathbf{F}(x, y, z) = \mathbf{i} + z\mathbf{j} + y\mathbf{k}$

(a) C_1: $\mathbf{r}_1(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t^2\mathbf{k}, \quad 0 \le t \le \pi$

(b) C_2: $\mathbf{r}_2(t) = (1 - 2t)\mathbf{i} + \pi^2 t\mathbf{k}, \quad 0 \le t \le 1$

29. $\mathbf{F}(x, y, z) = (2y + x)\mathbf{i} + (x^2 - z)\mathbf{j} + (2y - 4z)\mathbf{k}$

(a) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + t^2\mathbf{j} + \mathbf{k}, \quad 0 \le t \le 1$

(b) C_2: $\mathbf{r}_2(t) = t\mathbf{i} + t\mathbf{j} + (2t - 1)^2\mathbf{k}, \quad 0 \le t \le 1$

30. $\mathbf{F}(x, y, z) = -y\mathbf{i} + x\mathbf{j} + 3xz^2\mathbf{k}$

(a) C_1: $\mathbf{r}_1(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le \pi$

(b) C_2: $\mathbf{r}_2(t) = (1 - 2t)\mathbf{i} + \pi t\mathbf{k}, \quad 0 \le t \le 1$

31. $\mathbf{F}(x, y, z) = e^z(y\mathbf{i} + x\mathbf{j} + xy\mathbf{k})$

(a) C_1: $\mathbf{r}_1(t) = 4\cos t\mathbf{i} + 4\sin t\mathbf{j} + 3\mathbf{k}, \quad 0 \le t \le \pi$

(b) C_2: $\mathbf{r}_2(t) = (4 - 8t)\mathbf{i} + 3\mathbf{k}, \quad 0 \le t \le 1$

32. $\mathbf{F}(x, y, z) = y\sin z\mathbf{i} + x\sin z\mathbf{j} + xy\cos x\mathbf{k}$

(a) C_1: $\mathbf{r}_1(t) = t^2\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 2$

(b) C_2: $\mathbf{r}_2(t) = 4t\mathbf{i} + 4t\mathbf{j}, \quad 0 \le t \le 1$

33. Work A stone weighing 1 pound is attached to the end of a two-foot string and is whirled horizontally with one end held fixed. It makes 1 revolution per second. Find the work done by the force **F** that keeps the stone moving in a circular path. [*Hint:* Use Force = (mass)(centripetal acceleration).]

34. Work A grappling hook weighing 1 kilogram is attached to the end of a five-meter rope and is whirled horizontally with one end held fixed. It makes 0.5 revolution per second. Find the work done by the force **F** that keeps the grappling hook moving in a circular path. [*Hint:* Use Force = (mass)(centripetal acceleration).]

35. Work

A zip line is installed 50 feet above ground level. It runs to a point on the ground 50 feet away from the base of the installation. Show that the work done by the gravitational force field for a 175-pound person moving the length of the zip line is the same for each path.

(a) C_1: $\mathbf{r}_1(t) = t\mathbf{i} + (50 - t)\mathbf{j}$

(b) C_2: $\mathbf{r}_2(t) = t\mathbf{i} + \frac{1}{50}(50 - t)^2\mathbf{j}$

36. Work Can you find a path for the zip line in Exercise 35 such that the work done by the gravitational force field would differ from the amounts of work done for the two paths given? Explain why or why not.

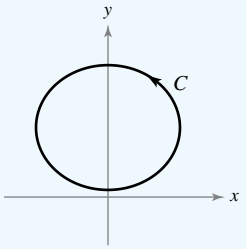
Exploring Concepts

37. Consider

$$\mathbf{F}(x, y) = \frac{y}{x^2 + y^2}\mathbf{i} - \frac{x}{x^2 + y^2}\mathbf{j}.$$

Explain how Theorem 15.7 allows you to compute $\int_C \mathbf{F} \cdot d\mathbf{r}$ easily.



38. Let

$$\mathbf{F}(x, y, z) = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k}$$

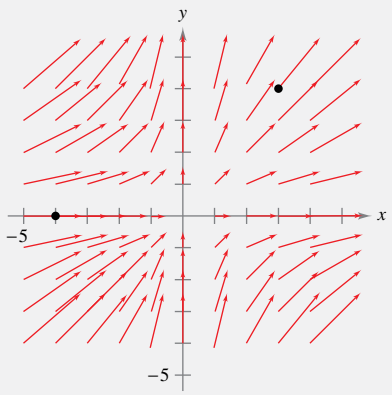
be a constant force vector field. Show that the work done in moving a particle along any path from P to Q is $W = \mathbf{F} \cdot \overrightarrow{PQ}$.

39. Use two different methods to evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$ along the path

$$\mathbf{r}(t) = \frac{1}{t}\mathbf{i} + 3t\mathbf{j}, \quad 0.5 \le t \le 2$$

where $\mathbf{F}(x, y) = (x^2y^2 - 3x)\mathbf{i} + \frac{2}{3}x^3y\mathbf{j}$.

40. **HOW DO YOU SEE IT?** Consider the force field shown in the figure. To print an enlarged copy of the graph, go to *MathGraphs.com.*

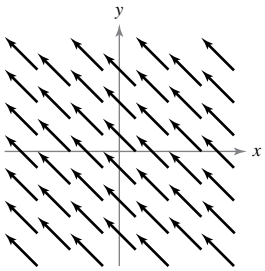


(a) Give a verbal argument that the force field is not conservative because you can identify two paths that require different amounts of work to move an object from $(-4, 0)$ to $(3, 4)$. Of the two paths, which requires the greater amount of work?

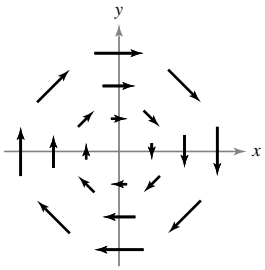
(b) Give a verbal argument that the force field is not conservative because you can find a closed curve C such that $\int_C \mathbf{F} \cdot d\mathbf{r} \neq 0$.

Graphical Reasoning **In Exercises 41 and 42, consider the force field shown in the figure. Is the force field conservative? Explain why or why not.**

41.



42.



True or False? **In Exercises 43–46, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

43. If C_1, C_2, and C_3 have the same initial and terminal points and $\int_{C_1} \mathbf{F} \cdot d\mathbf{r}_1 = \int_{C_2} \mathbf{F} \cdot d\mathbf{r}_2$, then $\int_{C_1} \mathbf{F} \cdot d\mathbf{r}_1 = \int_{C_3} \mathbf{F} \cdot d\mathbf{r}_3$.

44. If $\mathbf{F} = y\mathbf{i} + x\mathbf{j}$ and C is given by $\mathbf{r}(t) = 4 \sin t\mathbf{i} + 3 \cos t\mathbf{j}$ for $0 \le t \le \pi$, then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = 0.$$

45. If $\mathbf{F}$ is conservative in a region R bounded by a simple closed path and C lies within R, then $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path.

46. If $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ and $\frac{\partial M}{\partial x} = \frac{\partial N}{\partial y}$, then $\mathbf{F}$ is conservative.

47. **Harmonic Function** A function f is called *harmonic* when

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0.$$

Prove that if f is harmonic, then

$$\int_C \left(\frac{\partial f}{\partial y}\,dx - \frac{\partial f}{\partial x}\,dy\right) = 0$$

where C is a smooth closed curve in the plane.

48. **Kinetic and Potential Energy** The kinetic energy of an object moving through a conservative force field is decreasing at a rate of 15 units per minute. At what rate is the potential energy changing? Explain.

49. **Investigation** Let $\mathbf{F}(x, y) = \frac{y}{x^2 + y^2}\mathbf{i} - \frac{x}{x^2 + y^2}\mathbf{j}$.

(a) Show that $\frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}$.

(b) Let $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$ for $0 \le t \le \pi$. Find $\int_C \mathbf{F} \cdot d\mathbf{r}$.

(c) Let $\mathbf{r}(t) = \cos t\mathbf{i} - \sin t\mathbf{j}$ for $0 \le t \le \pi$. Find $\int_C \mathbf{F} \cdot d\mathbf{r}$.

(d) Let $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$ for $0 \le t \le 2\pi$. Find $\int_C \mathbf{F} \cdot d\mathbf{r}$.

(e) Do the results of parts (b)–(d) contradict Theorem 15.7? Why or why not?

(f) Show that $\nabla\left(\arctan\frac{x}{y}\right) = \mathbf{F}$.

15.4 Green's Theorem

GO DIGITAL

- **Use Green's Theorem to evaluate a line integral.**
- **Use alternative forms of Green's Theorem.**

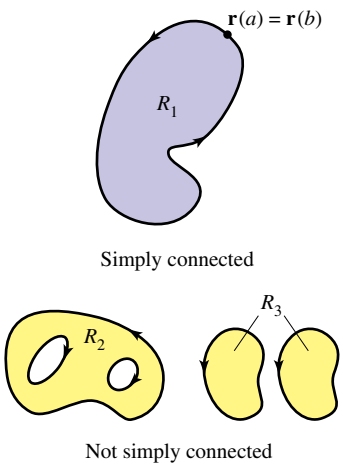

Figure 15.26

Green's Theorem

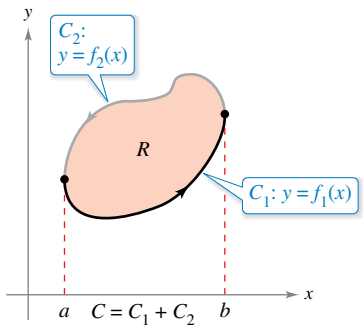
In this section, you will study **Green's Theorem,** named after the English mathematician George Green (1793–1841). This theorem states that the value of a double integral over a *simply connected* plane region R is determined by the value of a line integral around the boundary of R.

A curve C given by $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, where $a \le t \le b$, is **simple** when it does not cross itself—that is, $\mathbf{r}(c) \neq \mathbf{r}(d)$ for all c and d in the open interval (a, b). A connected plane region R is **simply connected** when every simple closed curve in R encloses only points that are in R (see Figure 15.26). Informally, a simply connected region cannot consist of separate parts or holes.

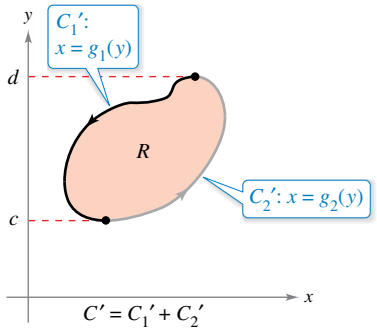
THEOREM 15.8 Green's Theorem

Let R be a simply connected region with a piecewise smooth boundary C, oriented counterclockwise (that is, C is traversed *once* so that the region R always lies to the *left*). If M and N have continuous first partial derivatives in an open region containing R, then

$$\int_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA.$$



R is vertically simple.



R is horizontally simple.

Figure 15.27

Proof A proof is given only for a region that is both vertically simple and horizontally simple, as shown in Figure 15.27.

$$\begin{aligned}\int_C M\,dx &= \int_{C_1} M\,dx + \int_{C_2} M\,dx \\ &= \int_a^b M(x, f_1(x))\,dx + \int_b^a M(x, f_2(x))\,dx \\ &= \int_a^b [M(x, f_1(x)) - M(x, f_2(x))]\,dx\end{aligned}$$

On the other hand,

$$\begin{aligned}\iint_R \frac{\partial M}{\partial y}\,dA &= \int_a^b \int_{f_1(x)}^{f_2(x)} \frac{\partial M}{\partial y}\,dy\,dx \\ &= \int_a^b M(x, y)\Big]_{f_1(x)}^{f_2(x)}\,dx \\ &= \int_a^b [M(x, f_2(x)) - M(x, f_1(x))]\,dx.\end{aligned}$$

Consequently,

$$\int_C M\,dx = -\iint_R \frac{\partial M}{\partial y}\,dA.$$

Similarly, you can use $g_1(y)$ and $g_2(y)$ to show that $\int_C N\,dy = \iint_R (\partial N/\partial x)\,dA$. By adding the integrals $\int_C M\,dx$ and $\int_C N\,dy$, you obtain the conclusion stated in the theorem. ∎

GO DIGITAL

An integral sign with a circle is sometimes used to indicate a line integral around a simple closed curve, as shown below. To indicate the orientation of the boundary, an arrow can be used. For instance, in the second integral, the arrow indicates that the boundary C is oriented counterclockwise.

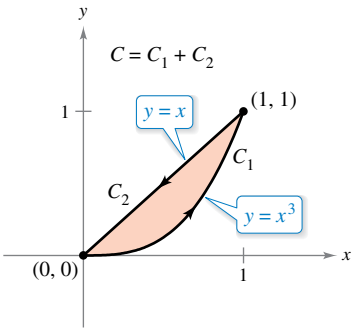
1. $\oint_C M\,dx + N\,dy$ **2.** $\oint_C M\,dx + N\,dy$

EXAMPLE 1 Using Green's Theorem

Use Green's Theorem to evaluate the line integral

$$\int_C y^3\,dx + (x^3 + 3xy^2)\,dy$$

where C is the path from $(0, 0)$ to $(1, 1)$ along the graph of $y = x^3$ and from $(1, 1)$ to $(0, 0)$ along the graph of $y = x$, as shown in Figure 15.28.



C is simple and closed, and the region R always lies to the left of C.
Figure 15.28

Solution Because $M = y^3$ and $N = x^3 + 3xy^2$, it follows that

$$\frac{\partial N}{\partial x} = 3x^2 + 3y^2 \quad \text{and} \quad \frac{\partial M}{\partial y} = 3y^2.$$

Applying Green's Theorem, you then have

$$\begin{aligned}
\int_C y^3\,dx + (x^3 + 3xy^2)\,dy &= \int_R\int \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA \\
&= \int_0^1 \int_{x^3}^{x} \left[(3x^2 + 3y^2) - 3y^2\right] dy\,dx \\
&= \int_0^1 \int_{x^3}^{x} 3x^2\,dy\,dx \\
&= \int_0^1 3x^2 y \Big]_{x^3}^{x} dx \\
&= \int_0^1 (3x^3 - 3x^5)\,dx \\
&= \left[\frac{3x^4}{4} - \frac{x^6}{2}\right]_0^1 \\
&= \frac{1}{4}.
\end{aligned}$$

GEORGE GREEN (1793–1841)

Green, a self-educated miller's son, first published the theorem that bears his name in 1828 in an essay on electricity and magnetism. At that time, there was almost no mathematical theory to explain electrical phenomena. "Considering how desirable it was that a power of universal agency, like electricity, should, as far as possible, be submitted to calculation, . . . I was induced to try whether it would be possible to discover any general relations existing between this function and the quantities of electricity in the bodies producing it."

Green's Theorem cannot be applied to every line integral. Among other restrictions stated in Theorem 15.8, the curve C must be simple and closed. When Green's Theorem does apply, however, it can save time. To show this, try using the techniques described in Section 15.2 to evaluate the line integral in Example 1. To do this, you would need to write the line integral as

$$\begin{aligned}
&\int_C y^3\,dx + (x^3 + 3xy^2)\,dy \\
&\qquad = \int_{C_1} y^3\,dx + (x^3 + 3xy^2)\,dy + \int_{C_2} y^3\,dx + (x^3 + 3xy^2)\,dy
\end{aligned}$$

where C_1 is the cubic path given by

$$\mathbf{r}(t) = t\mathbf{i} + t^3\mathbf{j}$$

from $t = 0$ to $t = 1$, and C_2 is the line segment given by

$$\mathbf{r}(t) = (1 - t)\mathbf{i} + (1 - t)\mathbf{j}$$

from $t = 0$ to $t = 1$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

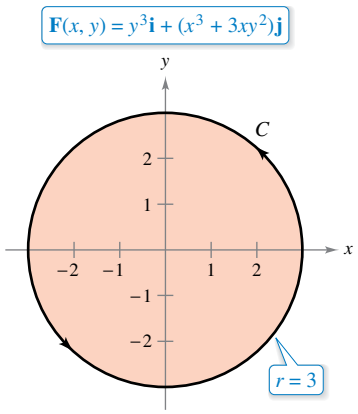

Figure 15.29

GO DIGITAL

EXAMPLE 2 Using Green's Theorem to Calculate Work

While subject to the force

$$\mathbf{F}(x, y) = y^3\mathbf{i} + (x^3 + 3xy^2)\mathbf{j}$$

a particle travels once around the circle of radius 3 shown in Figure 15.29. Use Green's Theorem to find the work done by $\mathbf{F}$.

Solution From Example 1, you know by Green's Theorem that

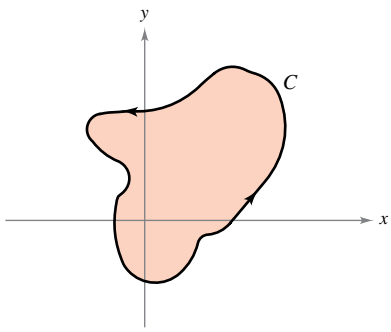
$$\int_C y^3\,dx + (x^3 + 3xy^2)\,dy = \iint_R 3x^2\,dA.$$

In polar coordinates, using $x = r\cos\theta$ and $dA = r\,dr\,d\theta$, the work done is

$$\begin{aligned}
W &= \iint_R 3x^2\,dA \\
&= \int_0^{2\pi}\int_0^3 3(r\cos\theta)^2 r\,dr\,d\theta \\
&= 3\int_0^{2\pi}\int_0^3 r^3\cos^2\theta\,dr\,d\theta \\
&= 3\int_0^{2\pi}\frac{r^4}{4}\cos^2\theta\,\Big]_0^3 d\theta \\
&= 3\int_0^{2\pi}\frac{81}{4}\cos^2\theta\,d\theta \\
&= \frac{243}{8}\int_0^{2\pi}(1 + \cos 2\theta)\,d\theta \\
&= \frac{243}{8}\left[\theta + \frac{\sin 2\theta}{2}\right]_0^{2\pi} \\
&= \frac{243\pi}{4}.
\end{aligned}$$

When evaluating line integrals over closed curves, remember that for conservative vector fields (those for which $\partial N/\partial x = \partial M/\partial y$), the value of the line integral is 0. This conclusion is a direct result from the statement of Green's Theorem:

$$\int_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)dA = 0.$$



C is closed.

Figure 15.30

EXAMPLE 3 Green's Theorem and Conservative Vector Fields

Evaluate the line integral

$$\int_C y^3\,dx + 3xy^2\,dy$$

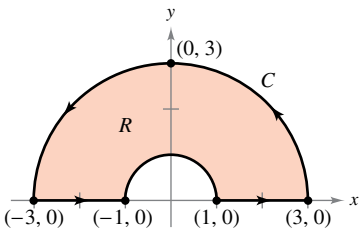
where C is the path shown in Figure 15.30.

Solution From this line integral, $M = y^3$ and $N = 3xy^2$. So, $\partial N/\partial x = 3y^2$ and $\partial M/\partial y = 3y^2$. This implies that the vector field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ is conservative, and because C is closed, you can conclude that

$$\int_C y^3\,dx + 3xy^2\,dy = 0.$$

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



C is piecewise smooth.
Figure 15.31

EXAMPLE 4 Using Green's Theorem

See LarsonCalculus.com for an interactive version of this type of example.

Evaluate

$$\int_C (\arctan x + y^2)\,dx + (e^y - x^2)\,dy$$

where C is the path enclosing the annular region shown in Figure 15.31.

Solution In polar coordinates, R is given by $1 \le r \le 3$ for $0 \le \theta \le \pi$. Moreover,

$$\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} = -2x - 2y = -2(r\cos\theta + r\sin\theta).$$

So, by Green's Theorem,

$$\begin{aligned}
\int_C (\arctan x + y^2)\,dx + (e^y - x^2)\,dy &= \iint_R -2(x + y)\,dA \\
&= \int_0^{\pi}\int_1^3 -2r(\cos\theta + \sin\theta)r\,dr\,d\theta \\
&= \int_0^{\pi} -2(\cos\theta + \sin\theta)\frac{r^3}{3}\Big]_1^3\,d\theta \\
&= \int_0^{\pi} -\frac{52}{3}(\cos\theta + \sin\theta)\,d\theta \\
&= -\frac{52}{3}\Big[\sin\theta - \cos\theta\Big]_0^{\pi} \\
&= -\frac{104}{3}.
\end{aligned}$$

In Examples 1, 2, and 4, Green's Theorem was used to evaluate line integrals as double integrals. You can also use the theorem to evaluate double integrals as line integrals. One useful application occurs when $\partial N/\partial x - \partial M/\partial y = 1$.

$$\begin{aligned}
\int_C M\,dx + N\,dy &= \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)dA \\
&= \iint_R 1\,dA \qquad \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} = 1 \\
&= \text{area of region } R
\end{aligned}$$

Among the many choices for M and N satisfying the stated condition, the choice of

$$M = -\frac{y}{2} \quad \text{and} \quad N = \frac{x}{2}$$

produces the following line integral for the area of region R.

THEOREM 15.9 Line Integral for Area

If R is a plane region bounded by a piecewise smooth simple closed curve C, oriented counterclockwise, then the area of R is given by

$$A = \frac{1}{2}\int_C x\,dy - y\,dx.$$

GO DIGITAL

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

EXAMPLE 5 Finding Area by a Line Integral

Use a line integral to find the area of the ellipse $(x^2/a^2) + (y^2/b^2) = 1$.

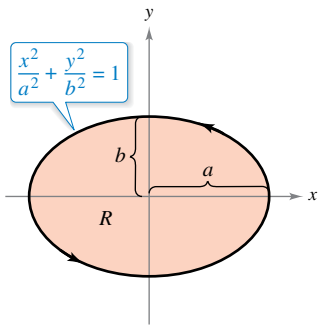

Figure 15.32

Solution Using Figure 15.32, you can induce a counterclockwise orientation to the elliptical path by letting $x = a\cos t$ and $y = b\sin t$, $0 \le t \le 2\pi$. So, the area is

$$\begin{aligned} A = \frac{1}{2}\int_C x\,dy - y\,dx &= \frac{1}{2}\int_0^{2\pi} [(a\cos t)(b\cos t)\,dt - (b\sin t)(-a\sin t)\,dt] \\ &= \frac{ab}{2}\int_0^{2\pi} (\cos^2 t + \sin^2 t)\,dt \\ &= \frac{ab}{2}\Big[t\Big]_0^{2\pi} \\ &= \pi ab. \end{aligned}$$

Green's Theorem can be extended to cover some regions that are not simply connected. This is demonstrated in the next example.

EXAMPLE 6 Green's Theorem Extended to a Region with a Hole

Let R be the region inside the ellipse $(x^2/9) + (y^2/4) = 1$ and outside the circle $x^2 + y^2 = 1$. Evaluate the line integral

$$\int_C 2xy\,dx + (x^2 + 2x)\,dy$$

where $C = C_1 + C_2$ is the boundary of R, as shown in Figure 15.33.

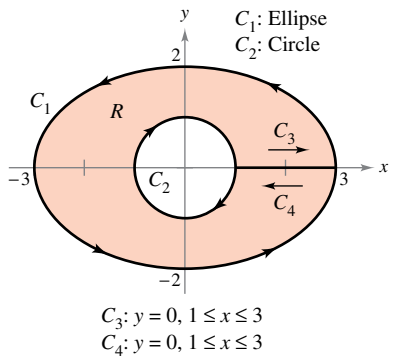

Figure 15.33

Solution To begin, introduce the line segments C_3 and C_4, as shown in Figure 15.33. Note that because the curves C_3 and C_4 have opposite orientations, the line integrals over them cancel. Furthermore, apply Green's Theorem to the region R using the boundary $C_1 + C_4 + C_2 + C_3$ to obtain

$$\begin{aligned} \int_C 2xy\,dx + (x^2 + 2x)\,dy &= \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA \\ &= \iint_R (2x + 2 - 2x)\,dA \\ &= 2\iint_R dA \\ &= 2(\text{area of } R) \\ &= 2(\pi ab - \pi r^2) \\ &= 2[\pi(3)(2) - \pi(1^2)] \\ &= 10\pi. \end{aligned}$$

In Section 15.1, a necessary and sufficient condition for conservative vector fields was listed. There, only one direction of the proof was shown. You can now outline the other direction, using Green's Theorem. Let $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$ be defined on an open disk R. You want to show that if M and N have continuous first partial derivatives and $\partial M/\partial y = \partial N/\partial x$, then $\mathbf{F}$ is conservative. Let C be a closed path forming the boundary of a connected region lying in R. Then, using the fact that $\partial M/\partial y = \partial N/\partial x$, apply Green's Theorem to conclude that

$$\int_C \mathbf{F}\cdot d\mathbf{r} = \int_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA = 0.$$

This, in turn, is equivalent to showing that $\mathbf{F}$ is conservative (see Theorem 15.7).

Alternative Forms of Green's Theorem

This section concludes with the derivation of two vector forms of Green's Theorem for regions in the plane. The extension of these vector forms to three dimensions is the basis for the discussion in the remaining sections of this chapter. For a vector field $\mathbf{F}$ in the plane, you can write

$$\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + 0\mathbf{k}$$

so that the curl of $\mathbf{F}$, as described in Section 15.1, is given by

$$\operatorname{curl} \mathbf{F} = \nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ M & N & 0 \end{vmatrix} = -\frac{\partial N}{\partial z}\mathbf{i} + \frac{\partial M}{\partial z}\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}.$$

Consequently,

$$(\operatorname{curl} \mathbf{F}) \cdot \mathbf{k} = \left[-\frac{\partial N}{\partial z}\mathbf{i} + \frac{\partial M}{\partial z}\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}\right] \cdot \mathbf{k} = \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}.$$

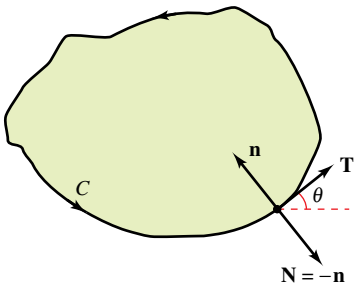
With appropriate conditions on $\mathbf{F}$, C, and R, you can write Green's Theorem in the vector form

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA \\ &= \iint_R (\operatorname{curl} \mathbf{F}) \cdot \mathbf{k}\, dA. \end{aligned}$$ First alternative form

The extension of this vector form of Green's Theorem to surfaces in space produces **Stokes's Theorem,** discussed in Section 15.8.

For the second vector form of Green's Theorem, assume the same conditions for $\mathbf{F}$, C, and R. Using the arc length parameter s for C, you have $\mathbf{r}(s) = x(s)\mathbf{i} + y(s)\mathbf{j}$. So, a unit tangent vector $\mathbf{T}$ to curve C is given by $\mathbf{r}'(s) = \mathbf{T} = x'(s)\mathbf{i} + y'(s)\mathbf{j}$. From Figure 15.34, note that the *outward* unit normal vector $\mathbf{N}$ can then be written as

$$\mathbf{N} = y'(s)\mathbf{i} - x'(s)\mathbf{j}.$$



$\mathbf{T} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$

$\mathbf{n} = \cos\left(\theta + \frac{\pi}{2}\right)\mathbf{i} + \sin\left(\theta + \frac{\pi}{2}\right)\mathbf{j}$

$= -\sin\theta\mathbf{i} + \cos\theta\mathbf{j}$

$\mathbf{N} = \sin\theta\mathbf{i} - \cos\theta\mathbf{j}$

Figure 15.34

Consequently, for $\mathbf{F}(x, y) = M\mathbf{i} + N\mathbf{j}$, you can apply Green's Theorem to obtain

$$\begin{aligned} \int_C \mathbf{F} \cdot \mathbf{N}\, ds &= \int_a^b (M\mathbf{i} + N\mathbf{j}) \cdot (y'(s)\mathbf{i} - x'(s)\mathbf{j})\, ds \\ &= \int_a^b \left(M\frac{dy}{ds} - N\frac{dx}{ds}\right) ds \\ &= \int_C M\, dy - N\, dx \\ &= \int_C -N\, dx + M\, dy \\ &= \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dA \qquad \text{Green's Theorem} \\ &= \iint_R \operatorname{div} \mathbf{F}\, dA. \end{aligned}$$

Therefore,

$$\int_C \mathbf{F} \cdot \mathbf{N}\, ds = \iint_R \operatorname{div} \mathbf{F}\, dA.$$ Second alternative form

The extension of this form to three dimensions is called the **Divergence Theorem** and will be discussed in Section 15.7. The physical interpretations of divergence and curl will be discussed in Sections 15.7 and 15.8.

15.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what it means for a curve to be simple. Explain what it means for a plane region to be simply connected.
2. Explain the usefulness of Green's Theorem.
3. What information do you learn from the integral sign $\oint_C$?
4. Describe how to find the area of a plane region bounded by a piecewise smooth simple closed curve that is oriented counterclockwise.

Verifying Green's Theorem **In Exercises 5–8, verify Green's Theorem by evaluating both integrals**

$$\int_C y^2\,dx + x^2\,dy = \int_R\int \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA$$

for the given path.

5. C: boundary of the region lying between the graphs of $y = x$ and $y = x^2$
6. C: boundary of the region lying between the graphs of $y = x$ and $y = \sqrt{x}$
7. C: square with vertices $(0, 0)$, $(1, 0)$, $(1, 1)$, and $(0, 1)$
8. C: rectangle with vertices $(0, 0)$, $(3, 0)$, $(3, 4)$, and $(0, 4)$

Verifying Green's Theorem **In Exercises 9 and 10, verify Green's Theorem by using a graphing utility to evaluate both integrals**

$$\int_C xe^y\,dx + e^x\,dy = \int_R\int \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA$$

for the given path.

9. C: circle given by $x^2 + y^2 = 4$
10. C: boundary of the region lying between the graphs of $y = x$ and $y = x^3$ in the first quadrant

Evaluating a Line Integral Using Green's Theorem **In Exercises 11–14, use Green's Theorem to evaluate the line integral $\int_C (y - x)\,dx + (2x - y)\,dy$ for the given path.**

11. C: boundary of the region lying between the graphs of $y = x$ and $y = x^2 - 2x$
12. C: $x = 2\cos\theta$, $y = \sin\theta$
13. C: boundary of the region lying inside the rectangle with vertices $(5, 3)$, $(-5, 3)$, $(-5, -3)$, and $(5, -3)$, and outside the square with vertices $(1, 1)$, $(-1, 1)$, $(-1, -1)$, and $(1, -1)$
14. C: boundary of the region lying inside the semicircle $y = \sqrt{25 - x^2}$ and outside the semicircle $y = \sqrt{9 - x^2}$

Evaluating a Line Integral Using Green's Theorem **In Exercises 15–24, use Green's Theorem to evaluate the line integral.**

15. $\int_C 2xy\,dx + (x + y)\,dy$

    C: boundary of the region lying between the graphs of $y = 0$ and $y = 1 - x^2$
16. $\int_C y^2\,dx + xy\,dy$

    C: boundary of the region lying between the graphs of $y = 0$, $y = \sqrt{x}$, and $x = 9$
17. $\int_C (x^2 - y^2)\,dx + 2xy\,dy$

    C: $x^2 + y^2 = 16$
18. $\int_C (x^2 - y^2)\,dx + 2xy\,dy$

    C: $r = 1 + \cos\theta$
19. $\int_C e^x \cos 2y\,dx - 2e^x \sin 2y\,dy$

    C: $x^2 + y^2 = a^2$
20. $\int_C 2\arctan\frac{y}{x}\,dx + \ln(x^2 + y^2)\,dy$

    C: $x = 4 + 2\cos\theta$, $y = 4 + \sin\theta$
21. $\int_C \cos y\,dx + (xy - x\sin y)\,dy$

    C: boundary of the region lying between the graphs of $y = x$ and $y = \sqrt{x}$
22. $\int_C (e^{-x^2/2} - y)\,dx + (e^{-y^2/2} + x)\,dy$

    C: boundary of the region lying between the graphs of the circle $x = 6\cos\theta$, $y = 6\sin\theta$ and the ellipse $x = 3\cos\theta$, $y = 2\sin\theta$
23. $\int_C (x - 3y)\,dx + (x + y)\,dy$

    C: boundary of the region lying between the graphs of $x^2 + y^2 = 1$ and $x^2 + y^2 = 9$
24. $\int_C 3x^2e^y\,dx + e^y\,dy$

    C: boundary of the region lying between the squares with vertices $(1, 1)$, $(-1, 1)$, $(-1, -1)$, and $(1, -1)$, and $(2, 2)$, $(-2, 2)$, $(-2, -2)$, and $(2, -2)$

Work **In Exercises 25–28, use Green's Theorem to calculate the work done by the force $\mathbf{F}$ on a particle that is moving counterclockwise around the closed path C.**

25. $\mathbf{F}(x, y) = xy\mathbf{i} + (x + y)\mathbf{j}$

    C: $x^2 + y^2 = 1$

26. $\mathbf{F}(x, y) = (e^x - 3y)\mathbf{i} + (e^y + 6x)\mathbf{j}$

C: $r = 2\cos\theta$

27. $\mathbf{F}(x, y) = (x^{3/2} - 3y)\mathbf{i} + \left(6x + 5\sqrt{y}\right)\mathbf{j}$

C: triangle with vertices $(0, 0)$, $(5, 0)$, and $(0, 5)$

28. $\mathbf{F}(x, y) = (3x^2 + y)\mathbf{i} + 4xy^2\mathbf{j}$

C: boundary of the region lying between the graphs of $y = \sqrt{x}$, $y = 0$, and $x = 9$

Area **In Exercises 29–32, use a line integral to find the area of the region R.**

29. R: region bounded by the graph of $x^2 + y^2 = 4$

30. R: triangle bounded by the graphs of $x = 0$, $3x - 2y = 0$, and $x + 2y = 8$

31. R: region bounded by the graphs of $y = 5x - 3$ and $y = x^2 + 1$

32. R: region inside the loop of the folium of Descartes bounded by the graph of

$$x = \frac{3t}{t^3 + 1}, \quad y = \frac{3t^2}{t^3 + 1}$$

Using Green's Theorem to Verify a Formula **In Exercises 33 and 34, use Green's Theorem to verify the line integral formula(s).**

33. The centroid of the region having area A bounded by the simple closed path C has coordinates

$$\bar{x} = \frac{1}{2A}\int_C x^2\,dy \quad \text{and} \quad \bar{y} = -\frac{1}{2A}\int_C y^2\,dx.$$

34. The area of a plane region bounded by the simple closed path C given in polar coordinates is

$$A = \frac{1}{2}\int_C r^2\,d\theta.$$

Centroid **In Exercises 35–38, use the results of Exercise 33 to find the centroid of the region.**

35. R: region bounded by the graphs of $y = 0$ and $4 - x^2$

36. R: region bounded by the graphs of $y = \sqrt{1 - x^2}$ and $y = 0$

37. R: region bounded by the graphs of $y = x^3$ and $y = x$, $0 \le x \le 1$

38. R: triangle with vertices $(-a, 0)$, $(a, 0)$, and (b, c), where $-a \le b \le a$

Area **In Exercises 39–42, use the result of Exercise 34 to find the area of the region bounded by the graph of the polar equation.**

39. $r = 6(1 - \cos\theta)$

40. $r = a\cos 3\theta$

41. $r = 1 + 2\cos\theta$ (inner loop)

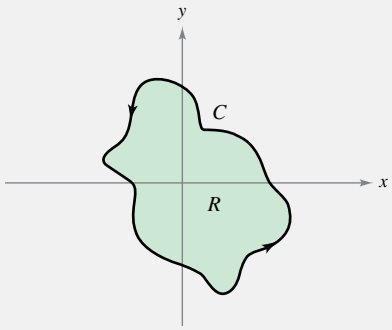
42. $r = \dfrac{3}{2 - \cos\theta}$

43. Maximum Value

(a) Evaluate $\int_{C_1} y^3\,dx + (27x - x^3)\,dy$, where C_1 is the unit circle given by $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$, for $0 \le t \le 2\pi$.

(b) Find the maximum value of $\int_C y^3\,dx + (27x - x^3)\,dy$, where C is any circle centered at the origin in the xy-plane, oriented counterclockwise.

44. HOW DO YOU SEE IT? The figure shows a region R bounded by a piecewise smooth simple closed path C.



(a) Is R simply connected? Explain.

(b) Explain why $\int_C f(x)\,dx + g(y)\,dy = 0$, where f and g are differentiable functions.

45. Green's Theorem: Region with a Hole Let R be the region inside the circle $x = 5\cos\theta$, $y = 5\sin\theta$ and outside the ellipse $x = 2\cos\theta$, $y = \sin\theta$. Evaluate the line integral

$$\int_C (e^{-x^2/2} - y)\,dx + (e^{-y^2/2} + x)\,dy$$

where $C = C_1 + C_2$ is the boundary of R, as shown in the figure.

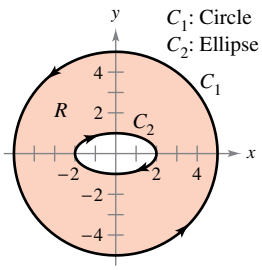


Figure for 45

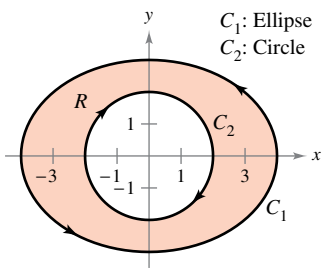

Figure for 46

46. Green's Theorem: Region with a Hole Let R be the region inside the ellipse $x = 4\cos\theta$, $y = 3\sin\theta$ and outside the circle $x = 2\cos\theta$, $y = 2\sin\theta$. Evaluate the line integral

$$\int_C (3x^2y + 1)\,dx + (x^3 + 4x)\,dy$$

where $C = C_1 + C_2$ is the boundary of R, as shown in the figure.

Exploring Concepts

47. Let

$$I = \int_C \frac{y\,dx - x\,dy}{x^2 + y^2}$$

where C is a circle oriented counterclockwise.

(a) Show that $I = 0$ when C does not contain the origin.

(b) What is I when C does contain the origin?

48. For each given path, verify Green's Theorem by showing that

$$\int_C y^2\,dx + x^2\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA.$$

For each path, which integral is easier to evaluate? Explain.

(a) C: triangle with vertices $(0, 0)$, $(4, 0)$, and $(4, 4)$

(b) C: circle given by $x^2 + y^2 = 1$

49. Proof

(a) Let C be the line segment joining (x_1, y_1) and (x_2, y_2). Show that $\int_C -y\,dx + x\,dy = x_1y_2 - x_2y_1$.

(b) Let (x_1, y_1), (x_2, y_2), . . . , (x_n, y_n) be the vertices of a polygon. Prove that the area enclosed is

$$\tfrac{1}{2}[(x_1y_2 - x_2y_1) + (x_2y_3 - x_3y_2) + \cdots + (x_{n-1}y_n - x_ny_{n-1}) + (x_ny_1 - x_1y_n)].$$

50. Area Use the result of Exercise 49(b) to find the area enclosed by the polygon with the given vertices.

(a) Pentagon: $(0, 0)$, $(2, 0)$, $(3, 2)$, $(1, 4)$, and $(-1, 1)$

(b) Hexagon: $(0, 0)$, $(2, 0)$, $(3, 2)$, $(2, 4)$, $(0, 3)$, and $(-1, 1)$

Proof **In Exercises 51 and 52, prove the identity, where R is a simply connected region with piecewise smooth boundary C. Assume that the required partial derivatives of the scalar functions f and g are continuous. The expressions $D_{\mathbf{N}}f$ and $D_{\mathbf{N}}g$ are the derivatives in the direction of the outward normal vector $\mathbf{N}$ of C and are defined by $D_{\mathbf{N}}f = \nabla f \cdot \mathbf{N}$ and $D_{\mathbf{N}}g = \nabla g \cdot \mathbf{N}$.**

51. Green's first identity:

$$\iint_R (f\nabla^2 g + \nabla f \cdot \nabla g)\,dA = \int_C fD_{\mathbf{N}}g\,ds$$

[*Hint:* Use the second alternative form of Green's Theorem and the property $\operatorname{div}(f\mathbf{G}) = f \operatorname{div}\mathbf{G} + \nabla f \cdot \mathbf{G}$.]

52. Green's second identity:

$$\iint_R (f\nabla^2 g - g\nabla^2 f)\,dA = \int_C (fD_{\mathbf{N}}g - gD_{\mathbf{N}}f)\,ds$$

(*Hint:* Use Green's first identity from Exercise 51 twice.)

53. Proof Let $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$, where M and N have continuous first partial derivatives in a simply connected region R. Prove that if C is simple, smooth, and closed, and $N_x = M_y$, then $\int_C \mathbf{F} \cdot d\mathbf{r} = 0$.

PUTNAM EXAM CHALLENGE

54. Find the least possible area of a convex set in the plane that intersects both branches of the hyperbola $xy = 1$ and both branches of the hyperbola $xy = -1$. (A set S in the plane is called *convex* if for any two points in S the line segment connecting them is contained in S.)

55. Let A and B be points on the same branch of the hyperbola $xy = 1$. Suppose that P is a point lying between A and B on this hyperbola, such that the area of the triangle APB is as large as possible. Show that the region bounded by the hyperbola and the chord AP has the same area as the region bounded by the hyperbola and the chord PB.

These problems were composed by the Committee on the Putnam Prize Competition. © The Mathematical Association of America. All rights reserved.

SECTION PROJECT

Hyperbolic and Trigonometric Functions

(a) Sketch the plane curve represented by the vector-valued function $\mathbf{r}(t) = \cosh t\mathbf{i} + \sinh t\mathbf{j}$ on the interval $0 \le t \le 5$. Show that the rectangular equation corresponding to $\mathbf{r}(t)$ is the hyperbola $x^2 - y^2 = 1$. Verify your sketch by using a graphing utility to graph the hyperbola.

(b) Let $P = (\cosh\phi, \sinh\phi)$ be the point on the hyperbola corresponding to $\mathbf{r}(\phi)$ for $\phi > 0$. Use the formula for area

$$A = \frac{1}{2}\int_C x\,dy - y\,dx$$

to verify that the area of the region shown in the figure is $\frac{1}{2}\phi$.

(c) Show that the area of the region shown in the figure is also given by the integral

$$A = \int_0^{\sinh\phi} \left[\sqrt{1 + y^2} - (\coth\phi)y\right] dy.$$

Confirm your answer in part (b) by evaluating this integral for $\phi = 1, 2, 4$, and 10.

(d) Consider the unit circle given by $x^2 + y^2 = 1$. Let θ be the angle formed by the x-axis and the radius to (x, y). The area of the corresponding sector is $\frac{1}{2}\theta$. That is, the trigonometric functions $f(\theta) = \cos\theta$ and $g(\theta) = \sin\theta$ could have been defined as the coordinates of the point $(\cos\theta, \sin\theta)$ on the unit circle that determines a sector of area $\frac{1}{2}\theta$. Write a short paragraph explaining how you could define the hyperbolic functions in a similar manner, using the "unit hyperbola" $x^2 - y^2 = 1$.

15.5 Parametric Surfaces

GO DIGITAL

- **Identify and sketch a parametric surface.**
- **Find a set of parametric equations to represent a surface.**
- **Find a normal vector and a tangent plane to a parametric surface.**
- **Find the area of a parametric surface.**

Parametric Surfaces

You already know how to represent a curve in the plane or in space by a set of parametric equations—or, equivalently, by a vector-valued function.

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} \qquad \text{Plane curve}$$

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} \qquad \text{Space curve}$$

In this section, you will learn how to represent a surface in space by a set of parametric equations—or by a vector-valued function. For curves, note that the vector-valued function $\mathbf{r}$ is a function of a *single* parameter t. For surfaces, the vector-valued function is a function of *two* parameters u and v.

Definition of Parametric Surface

Let x, y, and z be functions of u and v that are continuous on a domain D in the uv-plane. The set of points (x, y, z) given by

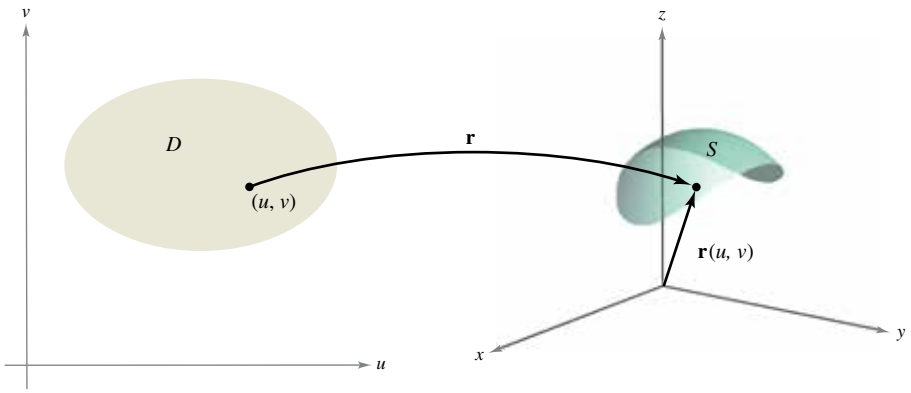
$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k} \qquad \text{Parametric surface}$$

is called a **parametric surface.** The equations

$$x = x(u, v), \quad y = y(u, v), \quad \text{and} \quad z = z(u, v) \qquad \text{Parametric equations}$$

are the **parametric equations** for the surface.

If S is a parametric surface given by the vector-valued function $\mathbf{r}$, then S is traced out by the position vector $\mathbf{r}(u, v)$ as the point (u, v) moves throughout the domain D, as shown in Figure 15.35.



The parametric surface S given by the vector-valued function $\mathbf{r}$, where $\mathbf{r}$ is a function of two variables u and v defined on a domain D

Figure 15.35

TECHNOLOGY Some graphing utilities are capable of graphing surfaces that are represented parametrically. If you have access to such a graphing utility, use it to graph some of the surfaces in the examples and exercises in this section.

GO DIGITAL

EXAMPLE 1 Sketching a Parametric Surface

Identify and sketch the parametric surface S given by

$$\mathbf{r}(u, v) = 3 \cos u\mathbf{i} + 3 \sin u\mathbf{j} + v\mathbf{k}$$

where $0 \le u \le 2\pi$ and $0 \le v \le 4$.

Solution Because $x = 3 \cos u$ and $y = 3 \sin u$, you know that for each point (x, y, z) on the surface, x and y are related by the equation

$$x^2 + y^2 = 3^2.$$

In other words, each cross section of S taken parallel to the xy-plane is a circle of radius 3, centered on the z-axis. Because $z = v$, where

$$0 \le v \le 4$$

you can see that the surface is a right circular cylinder of height 4. The radius of the cylinder is 3, and the z-axis forms the axis of the cylinder, as shown in Figure 15.36.

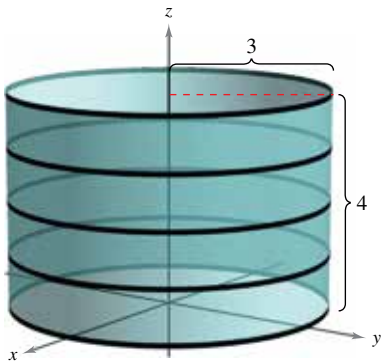

Figure 15.36

As with parametric representations of curves, parametric representations of surfaces are not unique. That is, there are many other sets of parametric equations that could be used to represent the surface shown in Figure 15.36.

EXAMPLE 2 Sketching a Parametric Surface

Identify and sketch the parametric surface S given by

$$\mathbf{r}(u, v) = \sin u \cos v\mathbf{i} + \sin u \sin v\mathbf{j} + \cos u\mathbf{k}$$

where $0 \le u \le \pi$ and $0 \le v \le 2\pi$.

Solution To identify the surface, you can try to use trigonometric identities to eliminate the parameters. After some experimentation, you can discover that

$$\begin{aligned} x^2 + y^2 + z^2 &= (\sin u \cos v)^2 + (\sin u \sin v)^2 + (\cos u)^2 \\ &= \sin^2 u \cos^2 v + \sin^2 u \sin^2 v + \cos^2 u \\ &= (\sin^2 u)(\cos^2 v + \sin^2 v) + \cos^2 u \\ &= \sin^2 u + \cos^2 u \\ &= 1. \end{aligned}$$

So, each point on S lies on the unit sphere, centered at the origin, as shown in Figure 15.37. For fixed $u = d_i$, $\mathbf{r}(u, v)$ traces out latitude circles

$$x^2 + y^2 = \sin^2 d_i, \quad 0 \le d_i \le \pi$$

that are parallel to the xy-plane, and for fixed $v = c_i$, $\mathbf{r}(u, v)$ traces out longitude (or meridian) half-circles.

To convince yourself further that $\mathbf{r}(u, v)$ traces out the entire unit sphere, recall that the parametric equations

$$x = \rho \sin \phi \cos \theta, \quad y = \rho \sin \phi \sin \theta, \quad \text{and} \quad z = \rho \cos \phi$$

where $0 \le \theta \le 2\pi$ and $0 \le \phi \le \pi$, describe the conversion from spherical to rectangular coordinates, as discussed in Section 11.7.

Finding Parametric Equations for Surfaces

In Examples 1 and 2, you were asked to identify the surface described by a given set of parametric equations. The reverse problem—that of writing a set of parametric equations for a given surface—is generally more difficult. One type of surface for which this problem is straightforward, however, is a surface that is given by $z = f(x, y)$. You can parametrize such a surface as

$$\mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + f(x, y)\mathbf{k}.$$

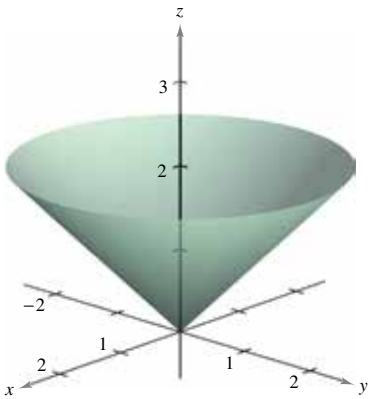

Figure 15.38

EXAMPLE 3 Representing a Surface Parametrically

Write a set of parametric equations for the cone given by

$$z = \sqrt{x^2 + y^2}$$

as shown in Figure 15.38.

Solution Because this surface is given in the form $z = f(x, y)$, you can let x and y be the parameters. Then the cone is represented by the vector-valued function

$$\mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + \sqrt{x^2 + y^2}\mathbf{k}$$

where (x, y) varies over the entire xy-plane. ■

A second type of surface that is easily represented parametrically is a surface of revolution. For instance, to represent the surface formed by revolving the graph of

$$y = f(x), \quad a \le x \le b$$

about the x-axis, use

$$x = u, \quad y = f(u)\cos v, \quad \text{and} \quad z = f(u)\sin v$$

where $a \le u \le b$ and $0 \le v \le 2\pi$.

EXAMPLE 4 Representing a Surface of Revolution Parametrically

See LarsonCalculus.com for an interactive version of this type of example.

Write a set of parametric equations for the surface of revolution obtained by revolving

$$f(x) = \frac{1}{x}, \quad 1 \le x \le 10$$

about the x-axis.

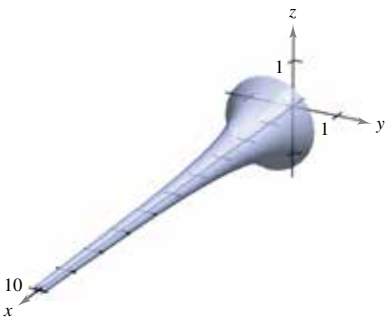

Figure 15.39

Solution Use the parameters u and v as described above to write

$$x = u, \quad y = f(u)\cos v = \frac{1}{u}\cos v, \quad \text{and} \quad z = f(u)\sin v = \frac{1}{u}\sin v$$

where

$$1 \le u \le 10 \quad \text{and} \quad 0 \le v \le 2\pi.$$

The resulting surface is a portion of *Gabriel's Horn,* as shown in Figure 15.39. ■

The surface of revolution in Example 4 is formed by revolving the graph of $y = f(x)$ about the x-axis. For other types of surfaces of revolution, a similar parametrization can be used. For instance, to parametrize the surface formed by revolving the graph of $x = f(z)$ about the z-axis, you can use

$$z = u, \quad x = f(u)\cos v, \quad \text{and} \quad y = f(u)\sin v.$$

GO DIGITAL

Normal Vectors and Tangent Planes

Let S be a parametric surface given by

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

over an open region D such that x, y, and z have continuous partial derivatives on D. The **partial derivatives of r** with respect to u and v are defined as

$$\mathbf{r}_u = \frac{\partial x}{\partial u}(u, v)\mathbf{i} + \frac{\partial y}{\partial u}(u, v)\mathbf{j} + \frac{\partial z}{\partial u}(u, v)\mathbf{k}$$

and

$$\mathbf{r}_v = \frac{\partial x}{\partial v}(u, v)\mathbf{i} + \frac{\partial y}{\partial v}(u, v)\mathbf{j} + \frac{\partial z}{\partial v}(u, v)\mathbf{k}.$$

Each of these partial derivatives is a vector-valued function that can be interpreted geometrically in terms of tangent vectors. For instance, if $v = v_0$ is held constant, then $\mathbf{r}(u, v_0)$ is a vector-valued function of a single parameter and defines a curve C_1 that lies on the surface S. The tangent vector to C_1 at the point

$$(x(u_0, v_0), y(u_0, v_0), z(u_0, v_0))$$

is given by

$$\mathbf{r}_u(u_0, v_0) = \frac{\partial x}{\partial u}(u_0, v_0)\mathbf{i} + \frac{\partial y}{\partial u}(u_0, v_0)\mathbf{j} + \frac{\partial z}{\partial u}(u_0, v_0)\mathbf{k}$$

as shown in Figure 15.40. In a similar way, if $u = u_0$ is held constant, then $\mathbf{r}(u_0, v)$ is a vector-valued function of a single parameter and defines a curve C_2 that lies on the surface S. The tangent vector to C_2 at the point $(x(u_0, v_0), y(u_0, v_0), z(u_0, v_0))$ is given by

$$\mathbf{r}_v(u_0, v_0) = \frac{\partial x}{\partial v}(u_0, v_0)\mathbf{i} + \frac{\partial y}{\partial v}(u_0, v_0)\mathbf{j} + \frac{\partial z}{\partial v}(u_0, v_0)\mathbf{k}.$$

If the normal vector $\mathbf{r}_u \times \mathbf{r}_v$ is not $\mathbf{0}$ for any (u, v) in D, then the surface S is called **smooth** and will have a tangent plane. Informally, a smooth surface is one that has no sharp points or cusps. For instance, spheres, ellipsoids, and paraboloids are smooth, whereas the cone given in Example 3 is not smooth.

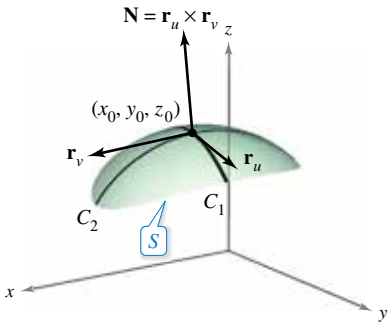

Figure 15.40

Normal Vector to a Smooth Parametric Surface

Let S be a smooth parametric surface

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

defined over an open region D in the uv-plane. Let (u_0, v_0) be a point in D. A normal vector at the point

$$(x_0, y_0, z_0) = (x(u_0, v_0), y(u_0, v_0), z(u_0, v_0))$$

is given by

$$\mathbf{N} = \mathbf{r}_u(u_0, v_0) \times \mathbf{r}_v(u_0, v_0) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & \frac{\partial z}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & \frac{\partial z}{\partial v} \end{vmatrix}.$$

Figure 15.40 shows the normal vector $\mathbf{r}_u \times \mathbf{r}_v$. The vector $\mathbf{r}_v \times \mathbf{r}_u$ is also normal to S and points in the opposite direction.

EXAMPLE 5 **Finding a Tangent Plane to a Parametric Surface**

Find an equation of the tangent plane to the paraboloid

$$\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + (u^2 + v^2)\mathbf{k}$$

at the point $(1, 2, 5)$.

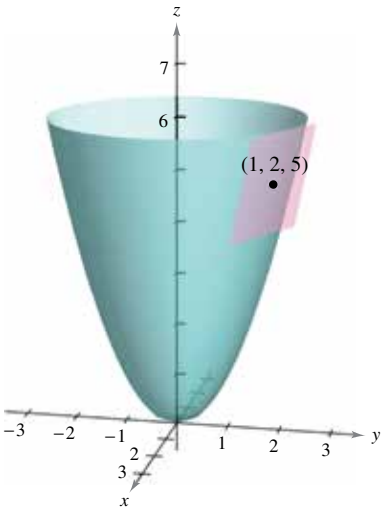

Figure 15.41

Solution The point in the uv-plane that is mapped to the point $(x, y, z) = (1, 2, 5)$ is $(u, v) = (1, 2)$. The partial derivatives of $\mathbf{r}$ are

$$\mathbf{r}_u = \mathbf{i} + 2u\mathbf{k} \quad \text{and} \quad \mathbf{r}_v = \mathbf{j} + 2v\mathbf{k}.$$

The normal vector is given by

$$\mathbf{r}_u \times \mathbf{r}_v = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & 2u \\ 0 & 1 & 2v \end{vmatrix} = -2u\mathbf{i} - 2v\mathbf{j} + \mathbf{k}$$

which implies that the normal vector at $(1, 2, 5)$ is

$$\mathbf{r}_u \times \mathbf{r}_v = -2\mathbf{i} - 4\mathbf{j} + \mathbf{k}.$$

So, an equation of the tangent plane at $(1, 2, 5)$ is

$$-2(x - 1) - 4(y - 2) + (z - 5) = 0$$
$$-2x - 4y + z = -5.$$

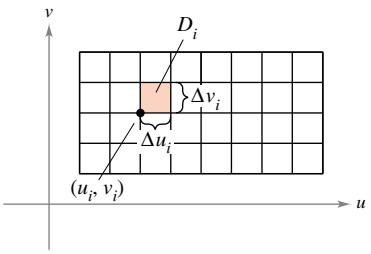
The tangent plane is shown in Figure 15.41.

Area of a Parametric Surface

To define the area of a parametric surface, you can use a development that is similar to that given in Section 14.5. Begin by constructing an inner partition of D consisting of n rectangles, where the area of the ith rectangle D_i is $\Delta A_i = \Delta u_i \Delta v_i$, as shown in Figure 15.42. In each D_i, let (u_i, v_i) be the point that is closest to the origin. At the point $(x_i, y_i, z_i) = (x(u_i, v_i), y(u_i, v_i), z(u_i, v_i))$ on the surface S, construct a tangent plane T_i. The area of the portion of S that corresponds to D_i, ΔS_i, can be approximated by a parallelogram ΔT_i in the tangent plane. That is, $\Delta T_i \approx \Delta S_i$. So, the surface area of S is given by $\Sigma\, \Delta S_i \approx \Sigma\, \Delta T_i$. The area of the parallelogram in the tangent plane is

$$\text{Area of } \Delta T_i = \|\Delta u_i \mathbf{r}_u \times \Delta v_i \mathbf{r}_v\| = \|\mathbf{r}_u \times \mathbf{r}_v\|\, \Delta u_i \Delta v_i$$

which leads to the next definition.



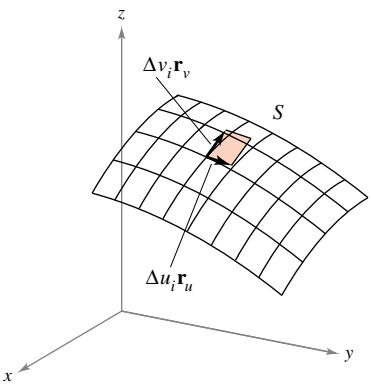


Figure 15.42

Area of a Parametric Surface

Let S be a smooth parametric surface

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

defined over an open region D in the uv-plane. If each point on the surface S corresponds to exactly one point in the domain D, then the **surface area** of S is given by

$$\text{Surface area} = \iint_S dS = \iint_D \|\mathbf{r}_u \times \mathbf{r}_v\|\, dA$$

where

$$\mathbf{r}_u = \frac{\partial x}{\partial u}\mathbf{i} + \frac{\partial y}{\partial u}\mathbf{j} + \frac{\partial z}{\partial u}\mathbf{k} \quad \text{and} \quad \mathbf{r}_v = \frac{\partial x}{\partial v}\mathbf{i} + \frac{\partial y}{\partial v}\mathbf{j} + \frac{\partial z}{\partial v}\mathbf{k}.$$

GO DIGITAL

For a surface S given by $z = f(x, y)$, this formula for surface area corresponds to that given in Section 14.5. To show this, parametrize the surface using the vector-valued function $\mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} + f(x, y)\mathbf{k}$ defined over the region R in the xy-plane. Using $\mathbf{r}_x = \mathbf{i} + f_x(x, y)\mathbf{k}$ and $\mathbf{r}_y = \mathbf{j} + f_y(x, y)\mathbf{k}$, you have

$$\mathbf{r}_x \times \mathbf{r}_y = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & f_x(x, y) \\ 0 & 1 & f_y(x, y) \end{vmatrix} = -f_x(x, y)\mathbf{i} - f_y(x, y)\mathbf{j} + \mathbf{k}$$

and

$$\|\mathbf{r}_x \times \mathbf{r}_y\| = \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1}.$$

This implies that the surface area of S is

$$\begin{aligned} \text{Surface area} &= \iint_R \|\mathbf{r}_x \times \mathbf{r}_y\| \, dA \\ &= \iint_R \sqrt{1 + [f_x(x, y)]^2 + [f_y(x, y)]^2} \, dA. \end{aligned}$$

EXAMPLE 6 Finding Surface Area

Because of high surface gravity, the shape of a neutron star is almost a perfect sphere. Using the surface area along with other data, scientists can estimate the mass and radius of the star.

Find the surface area of the unit sphere

$$\mathbf{r}(u, v) = \sin u \cos v\mathbf{i} + \sin u \sin v\mathbf{j} + \cos u\mathbf{k}$$

where the domain D is $0 \le u \le \pi$ and $0 \le v \le 2\pi$.

Solution Begin by calculating $\mathbf{r}_u$ and $\mathbf{r}_v$.

$$\mathbf{r}_u = \cos u \cos v\mathbf{i} + \cos u \sin v\mathbf{j} - \sin u\mathbf{k}$$
$$\mathbf{r}_v = -\sin u \sin v\mathbf{i} + \sin u \cos v\mathbf{j}$$

The cross product of these two vectors is

$$\begin{aligned} \mathbf{r}_u \times \mathbf{r}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos u \cos v & \cos u \sin v & -\sin u \\ -\sin u \sin v & \sin u \cos v & 0 \end{vmatrix} \\ &= \sin^2 u \cos v\mathbf{i} + \sin^2 u \sin v\mathbf{j} + \sin u \cos u\mathbf{k} \end{aligned}$$

which implies that

$$\begin{aligned} \|\mathbf{r}_u \times \mathbf{r}_v\| &= \sqrt{(\sin^2 u \cos v)^2 + (\sin^2 u \sin v)^2 + (\sin u \cos u)^2} \\ &= \sqrt{\sin^4 u + \sin^2 u \cos^2 u} \\ &= \sqrt{\sin^2 u} \\ &= \sin u. \qquad \sin u > 0 \text{ for } 0 \le u \le \pi \end{aligned}$$

Finally, the surface area of the sphere is

$$\begin{aligned} A &= \iint_D \|\mathbf{r}_u \times \mathbf{r}_v\| \, dA \\ &= \int_0^{2\pi} \int_0^{\pi} \sin u \, du \, dv \\ &= \int_0^{2\pi} 2 \, dv \\ &= 4\pi. \end{aligned}$$

The surface in Example 6 does not quite fulfill the hypothesis that each point on the surface corresponds to exactly one point in D. For this surface, $\mathbf{r}(u, 0) = \mathbf{r}(u, 2\pi)$ for any fixed value of u. However, because the overlap consists of only a semicircle (which has no area), you can still apply the formula for the area of a parametric surface.

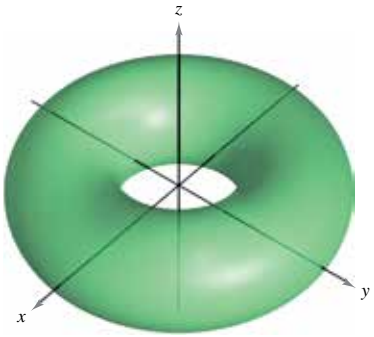

Figure 15.43

EXAMPLE 7 Finding Surface Area

Find the surface area of the torus given by

$$\mathbf{r}(u, v) = (2 + \cos u)\cos v\mathbf{i} + (2 + \cos u)\sin v\mathbf{j} + \sin u\mathbf{k}$$

where the domain D is given by $0 \le u \le 2\pi$ and $0 \le v \le 2\pi$. (See Figure 15.43.)

Solution Begin by calculating $\mathbf{r}_u$ and $\mathbf{r}_v$.

$$\mathbf{r}_u = -\sin u \cos v\mathbf{i} - \sin u \sin v\mathbf{j} + \cos u\mathbf{k}$$
$$\mathbf{r}_v = -(2 + \cos u)\sin v\mathbf{i} + (2 + \cos u)\cos v\mathbf{j}$$

The cross product of these two vectors is

$$\mathbf{r}_u \times \mathbf{r}_v = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin u \cos v & -\sin u \sin v & \cos u \\ -(2 + \cos u)\sin v & (2 + \cos u)\cos v & 0 \end{vmatrix}$$
$$= -(2 + \cos u)(\cos v \cos u\mathbf{i} + \sin v \cos u\mathbf{j} + \sin u\mathbf{k})$$

which implies that

$$\begin{aligned} \|\mathbf{r}_u \times \mathbf{r}_v\| &= (2 + \cos u)\sqrt{(\cos v \cos u)^2 + (\sin v \cos u)^2 + \sin^2 u} \\ &= (2 + \cos u)\sqrt{\cos^2 u(\cos^2 v + \sin^2 v) + \sin^2 u} \\ &= (2 + \cos u)\sqrt{\cos^2 u + \sin^2 u} \\ &= 2 + \cos u. \end{aligned}$$

Finally, the surface area of the torus is

$$\begin{aligned} A &= \iint_D \|\mathbf{r}_u \times \mathbf{r}_v\|\, dA \\ &= \int_0^{2\pi}\int_0^{2\pi} (2 + \cos u)\, du\, dv \\ &= \int_0^{2\pi} 4\pi\, dv \\ &= 8\pi^2. \end{aligned}$$

■

Exploration

For the torus in Example 7, describe the function $\mathbf{r}(u, v)$ for fixed u. Then describe the function $\mathbf{r}(u, v)$ for fixed v.

For a surface of revolution, you can show that the formula for surface area given in Section 7.4 is equivalent to the formula given in this section. For instance, suppose f is a nonnegative function such that f' is continuous over the interval $[a, b]$. Let S be the surface of revolution formed by revolving the graph of f, where $a \le x \le b$, about the x-axis. From Section 7.4, you know that the surface area is given by

$$\text{Surface area} = 2\pi\int_a^b f(x)\sqrt{1 + [f'(x)]^2}\, dx.$$

To represent S parametrically, let

$$x = u, \quad y = f(u)\cos v, \quad \text{and} \quad z = f(u)\sin v$$

where $a \le u \le b$ and $0 \le v \le 2\pi$. Then

$$\mathbf{r}(u, v) = u\mathbf{i} + f(u)\cos v\mathbf{j} + f(u)\sin v\mathbf{k}.$$

Try showing that the formula

$$\text{Surface area} = \iint_D \|\mathbf{r}_u \times \mathbf{r}_v\|\, dA$$

is equivalent to the formula given above (see Exercise 58).

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

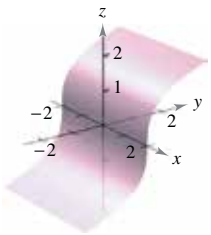
GO DIGITAL

Concept Check

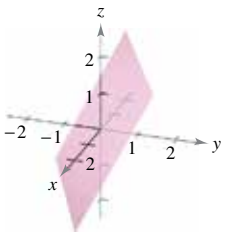
1. Explain how a parametric surface is represented by a vector-valued function and how the vector-valued function is used to sketch the parametric surface.
2. A surface S is represented by $z = f(x, y)$. What are the parametric equations for S?

Matching In Exercises 3–8, match the vector-valued function with its graph. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]

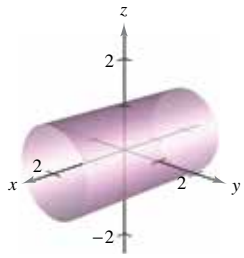
(a)



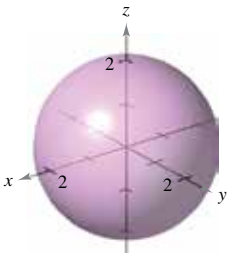
(b)



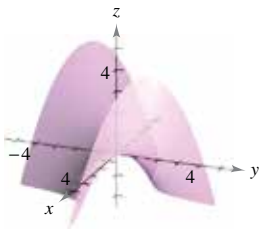
(c)



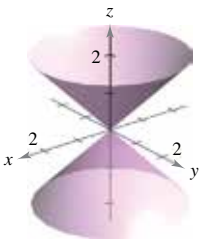
(d)



(e)



(f)



3. $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + uv\mathbf{k}$
4. $\mathbf{r}(u, v) = u\cos v\mathbf{i} + u\sin v\mathbf{j} + u\mathbf{k}$
5. $\mathbf{r}(u, v) = u\mathbf{i} + \frac{1}{2}(u + v)\mathbf{j} + v\mathbf{k}$
6. $\mathbf{r}(u, v) = v\mathbf{i} + \cos u\mathbf{j} + \sin u\mathbf{k}$
7. $\mathbf{r}(u, v) = 2\cos v\cos u\mathbf{i} + 2\cos v\sin u\mathbf{j} + 2\sin v\mathbf{k}$
8. $\mathbf{r}(u, v) = u\mathbf{i} + \frac{1}{4}v^3\mathbf{j} + v\mathbf{k}$

Sketching a Parametric Surface In Exercises 9–12, find the rectangular equation for the surface by eliminating the parameters from the vector-valued function. Identify the surface and sketch its graph.

9. $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + \frac{v}{2}\mathbf{k}$
10. $\mathbf{r}(u, v) = 2u\cos v\mathbf{i} + 2u\sin v\mathbf{j} + \frac{1}{2}u^2\mathbf{k}$
11. $\mathbf{r}(u, v) = 2\cos u\mathbf{i} + v\mathbf{j} + 2\sin u\mathbf{k}$
12. $\mathbf{r}(u, v) = 3\cos v\cos u\mathbf{i} + 3\cos v\sin u\mathbf{j} + 5\sin v\mathbf{k}$

Graphing a Parametric Surface In Exercises 13–18, use a graphing utility to graph the surface represented by the vector-valued function.

13. $\mathbf{r}(u, v) = 2u\cos v\mathbf{i} + 2u\sin v\mathbf{j} + u^4\mathbf{k}$
$0 \le u \le 1, \quad 0 \le v \le 2\pi$
14. $\mathbf{r}(u, v) = 2\cos v\cos u\mathbf{i} + 4\cos v\sin u\mathbf{j} + \sin v\mathbf{k}$
$0 \le u \le 2\pi, \quad 0 \le v \le 2\pi$
15. $\mathbf{r}(u, v) = 2\sinh u\cos v\mathbf{i} + \sinh u\sin v\mathbf{j} + \cosh u\mathbf{k}$
$0 \le u \le 2, \quad 0 \le v \le 2\pi$
16. $\mathbf{r}(u, v) = 2u\cos v\mathbf{i} + 2u\sin v\mathbf{j} + v\mathbf{k}$
$0 \le u \le 1, \quad 0 \le v \le 3\pi$
17. $\mathbf{r}(u, v) = (u - \sin u)\cos v\mathbf{i} + (1 - \cos u)\sin v\mathbf{j} + u\mathbf{k}$
$0 \le u \le \pi, \quad 0 \le v \le 2\pi$
18. $\mathbf{r}(u, v) = \cos^3 u\cos v\mathbf{i} + \sin^3 u\sin v\mathbf{j} + u\mathbf{k}$
$0 \le u \le \frac{\pi}{2}, \quad 0 \le v \le 2\pi$

Representing a Surface Parametrically In Exercises 19–28, find a vector-valued function whose graph is the indicated surface.

19. The plane $z = 3y$
20. The plane $x + y + z = 6$
21. The cone $y = \sqrt{4x^2 + 9z^2}$
22. The cone $x = \sqrt{16y^2 + z^2}$
23. The cylinder $x^2 + y^2 = 25$
24. The cylinder $4x^2 + y^2 = 16$
25. The paraboloid $x = y^2 + z^2 + 7$
26. The ellipsoid $\frac{x^2}{9} + \frac{y^2}{4} + \frac{z^2}{1} = 1$
27. The part of the plane $z = 4$ that lies inside the cylinder $x^2 + y^2 = 9$
28. The part of the paraboloid $z = x^2 + y^2$ that lies inside the cylinder $x^2 + y^2 = 9$

Representing a Surface of Revolution Parametrically In Exercises 29–34, write a set of parametric equations for the surface of revolution obtained by revolving the graph of the function about the given axis.

	Function	Axis of Revolution
29.	$y = \frac{x}{2}, \quad 0 \le x \le 6$	x-axis
30.	$y = \sqrt{x}, \quad 0 \le x \le 4$	x-axis
31.	$x = \sin z, \quad 0 \le z \le \pi$	z-axis
32.	$x = z - 2, \quad 2 \le z \le 5$	z-axis
33.	$z = \cos^2 y, \quad \frac{\pi}{2} \le y \le \pi$	y-axis
34.	$z = y^2 + 1, \quad 0 \le y \le 2$	y-axis

Finding a Tangent Plane **In Exercises 35–38, find an equation of the tangent plane to the surface represented by the vector-valued function at the given point.**

35. $\mathbf{r}(u, v) = 3\cos v\cos u\mathbf{i} + 2\cos v\sin u\mathbf{j} + 4\sin v\mathbf{k}$, $(0, \sqrt{3}, 2)$

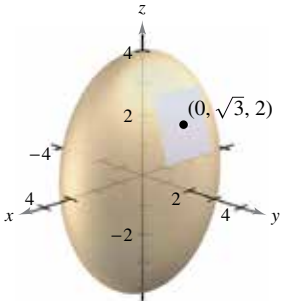

Figure for 35

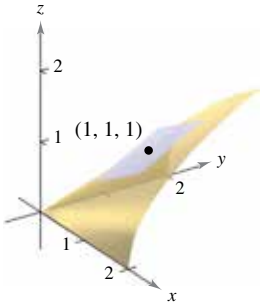

Figure for 36

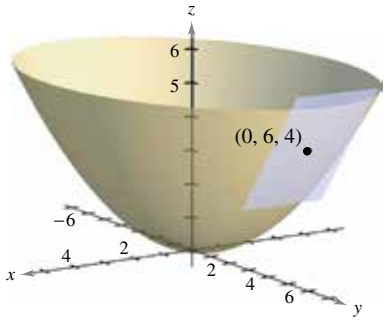
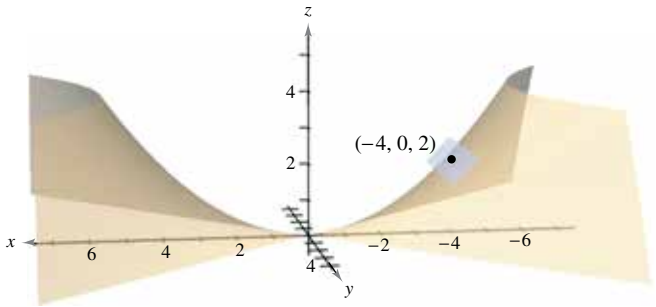
36. $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + \sqrt{uv}\mathbf{k}$, $(1, 1, 1)$

37. $\mathbf{r}(u, v) = 2u\cos v\mathbf{i} + 3u\sin v\mathbf{j} + u^2\mathbf{k}$, $(0, 6, 4)$



38. $\mathbf{r}(u, v) = 2u\cosh v\mathbf{i} + 2u\sinh v\mathbf{j} + \frac{1}{2}u^2\mathbf{k}$, $(-4, 0, 2)$



Finding Surface Area **In Exercises 39–44, find the area of the surface over the given region. Use a graphing utility to verify your results.**

39. $\mathbf{r}(u, v) = 4u\mathbf{i} - v\mathbf{j} + v\mathbf{k}$, $0 \le u \le 2$, $0 \le v \le 1$

40. $\mathbf{r}(u, v) = 2u\cos v\mathbf{i} + 2u\sin v\mathbf{j} + u^2\mathbf{k}$, $0 \le u \le 2$, $0 \le v \le 2\pi$

41. $\mathbf{r}(u, v) = au\cos v\mathbf{i} + au\sin v\mathbf{j} + u\mathbf{k}$, $0 \le u \le b$, $0 \le v \le 2\pi$

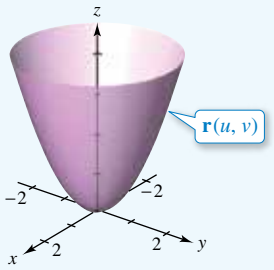
42. $\mathbf{r}(u, v) = (a + b\cos v)\cos u\mathbf{i} + (a + b\cos v)\sin u\mathbf{j} + b\sin v\mathbf{k}$, $a > b$, $0 \le u \le 2\pi$, $0 \le v \le 2\pi$

43. $\mathbf{r}(u, v) = \sqrt{u}\cos v\mathbf{i} + \sqrt{u}\sin v\mathbf{j} + u\mathbf{k}$, $0 \le u \le 4$, $0 \le v \le 2\pi$

44. $\mathbf{r}(u, v) = \sin u\cos v\mathbf{i} + u\mathbf{j} + \sin u\sin v\mathbf{k}$, $0 \le u \le \pi$, $0 \le v \le 2\pi$

Exploring Concepts

In Exercises 45–48, determine how the graph of the surface $\mathbf{s}(u, v)$ differs from the graph of the surface $\mathbf{r}(u, v) = u\cos v\mathbf{i} + u\sin v\mathbf{j} + u^2\mathbf{k}$, where $0 \le u \le 2$ and $0 \le v \le 2\pi$, as shown in the figure. (It is not necessary to graph s.)



45. $\mathbf{s}(u, v) = u\cos v\mathbf{i} + u\sin v\mathbf{j} - u^2\mathbf{k}$
$0 \le u \le 2, \quad 0 \le v \le 2\pi$

46. $\mathbf{s}(u, v) = u\cos v\mathbf{i} + u^2\mathbf{j} + u\sin v\mathbf{k}$
$0 \le u \le 2, \quad 0 \le v \le 2\pi$

47. $\mathbf{s}(u, v) = u\cos v\mathbf{i} + u\sin v\mathbf{j} + u^2\mathbf{k}$
$0 \le u \le 3, \quad 0 \le v \le 2\pi$

48. $\mathbf{s}(u, v) = 4u\cos v\mathbf{i} + 4u\sin v\mathbf{j} + u^2\mathbf{k}$
$0 \le u \le 2, \quad 0 \le v \le 2\pi$

49. Representing a Cone Parametrically Show that the cone in Example 3 can be represented parametrically by $\mathbf{r}(u, v) = u\cos v\mathbf{i} + u\sin v\mathbf{j} + u\mathbf{k}$, where $u \ge 0$ and $0 \le v \le 2\pi$.

50. HOW DO YOU SEE IT? The figures below are graphs of $\mathbf{r}(u, v) = u\mathbf{i} + \sin u\cos v\mathbf{j} + \sin u\sin v\mathbf{k}$, where $0 \le u \le \pi/2$ and $0 \le v \le 2\pi$. Match each of the four graphs with the point in space from which the surface is viewed.

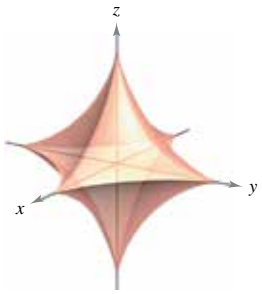
51. Astroidal Sphere An equation of an **astroidal sphere** in x, y, and z is

$$x^{2/3} + y^{2/3} + z^{2/3} = a^{2/3}.$$

A graph of an astroidal sphere is shown below. Show that this surface can be represented parametrically by

$$\mathbf{r}(u, v) = a \sin^3 u \cos^3 v\mathbf{i} + a \sin^3 u \sin^3 v\mathbf{j} + a \cos^3 u\mathbf{k}$$

where $0 \le u \le \pi$ and $0 \le v \le 2\pi$.



52. Different Views of a Surface Use a graphing utility to graph the vector-valued function

$$\mathbf{r}(u, v) = u \cos v\mathbf{i} + u \sin v\mathbf{j} + v\mathbf{k}, \quad 0 \le u \le \pi, \quad 0 \le v \le \pi$$

from each of the points $(10, 0, 0)$, $(0, 0, 10)$, and $(10, 10, 10)$.

53. Investigation Use a graphing utility to graph the torus

$$\mathbf{r}(u, v) = (a + b \cos v) \cos u\mathbf{i} + (a + b \cos v) \sin u\mathbf{j} + b \sin v\mathbf{k}$$

for each set of values of a and b, where $0 \le u \le 2\pi$ and $0 \le v \le 2\pi$. Use the results to describe the effects of a and b on the shape of the torus.

(a) $a = 4, \quad b = 1$

(b) $a = 4, \quad b = 2$

(c) $a = 8, \quad b = 1$

(d) $a = 8, \quad b = 3$

54. Investigation Consider the function in Exercise 16.

(a) Sketch a graph of the function where u is held constant at $u = 1$. Identify the graph.

(b) Sketch a graph of the function where v is held constant at $v = 2\pi/3$. Identify the graph.

(c) Assume that a surface is represented by the vector-valued function $\mathbf{r} = \mathbf{r}(u, v)$. What generalization can you make about the graph of the function when one of the parameters is held constant?

55. Surface Area The surface of the dome on a new museum is given by

$$\mathbf{r}(u, v) = 20 \sin u \cos v\mathbf{i} + 20 \sin u \sin v\mathbf{j} + 20 \cos u\mathbf{k}$$

where $0 \le u \le \pi/3$, $0 \le v \le 2\pi$, and $\mathbf{r}$ is in meters. Find the surface area of the dome.

56. Hyperboloid Find a vector-valued function for the hyperboloid

$$x^2 + y^2 - z^2 = 1$$

and determine the tangent plane at $(1, 0, 0)$.

57. Area Use a graphing utility to graph one turn of the spiral ramp $\mathbf{r}(u, v) = u \cos v\mathbf{i} + u \sin v\mathbf{j} + 2v\mathbf{k}$, where $0 \le u \le 3$ and $0 \le v \le 2\pi$. Then analytically find the area of one turn of the spiral ramp.

58. Surface Area Let f be a nonnegative function such that f' is continuous over the interval $[a, b]$. Let S be the surface of revolution formed by revolving the graph of f, where $a \le x \le b$, about the x-axis. Let $x = u$, $y = f(u) \cos v$, and $z = f(u) \sin v$, where $a \le u \le b$ and $0 \le v \le 2\pi$. Then S is represented parametrically by

$$\mathbf{r}(u, v) = u\mathbf{i} + f(u) \cos v\mathbf{j} + f(u) \sin v\mathbf{k}.$$

Show that the following formulas are equivalent.

$$\text{Surface area} = 2\pi \int_a^b f(x)\sqrt{1 + [f'(x)]^2}\, dx$$

$$\text{Surface area} = \int_D \int \|\mathbf{r}_u \times \mathbf{r}_v\|\, dA$$

59. Parametric Surfaces The parametric equations

$$x = 3 + [7 - \cos(3u - 2v) - 2 \cos(3u + v)]\sin u$$

$$y = 3 + [7 - \cos(3u - 2v) - 2 \cos(3u + v)]\cos u$$

$$z = \sin(3u - 2v) + 2 \sin(3u + v)$$

where $-\pi \le u \le \pi$ and $-\pi \le v \le \pi$, represent the surface shown below. Create your own parametric surface using a graphing utility.

60. Möbius Strip The surface shown in the figure is called a **Möbius strip** and can be represented by the parametric equations

$$x = \left(a + u \cos\frac{v}{2}\right) \cos v, \quad y = \left(a + u \cos\frac{v}{2}\right) \sin v, \quad z = u \sin\frac{v}{2}$$

where $-1 \le u \le 1$, $0 \le v \le 2\pi$, and $a = 3$. Graph other Möbius strips for different values of a using a graphing utility.

- Evaluate a surface integral as a double integral.
- Evaluate a surface integral for a parametric surface.
- Determine the orientation of a surface.
- Describe the concept of a flux integral.

Surface Integrals

The remainder of this chapter deals primarily with **surface integrals.** In this section, you will first consider surfaces given by $z = g(x, y)$. Then, you will consider more general surfaces given in parametric form.

Let S be a surface given by $z = g(x, y)$ and let R be its projection onto the xy-plane, as shown in Figure 15.44. Let g, g_x, and g_y be continuous at all points in R and let f be a scalar function defined on S. Employing the procedure used to find surface area in Section 14.5, evaluate f at (x_i, y_i, z_i) and form the sum

$$\sum_{i=1}^{n} f(x_i, y_i, z_i)\,\Delta S_i$$

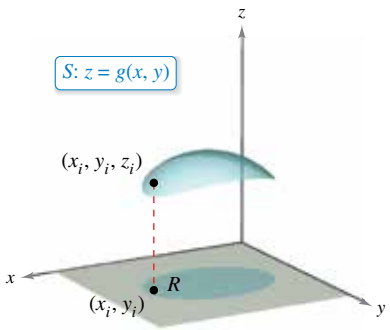
where

$$\Delta S_i \approx \sqrt{1 + [g_x(x_i, y_i)]^2 + [g_y(x_i, y_i)]^2}\,\Delta A_i.$$

Provided the limit of this sum as $\|\Delta\|$ approaches 0 exists, the **surface integral of f over S** is defined as

$$\iint_S f(x, y, z)\,dS = \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(x_i, y_i, z_i)\,\Delta S_i.$$

This integral can be evaluated by a double integral.



Scalar function f assigns a number to each point of S.

Figure 15.44

THEOREM 15.10 Evaluating a Surface Integral

Let S be a surface given by $z = g(x, y)$ and let R be its projection onto the xy-plane. If g, g_x, and g_y are continuous on R, and f is continuous on S, then the surface integral of f over S is

$$\iint_S f(x, y, z)\,dS = \iint_R f(x, y, g(x, y))\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}\,dA.$$

For surfaces described by functions of x and z (or y and z), you can make the following adjustments to Theorem 15.10. If S is the graph of $y = g(x, z)$, and R is its projection onto the xz-plane, then

$$\iint_S f(x, y, z)\,dS = \iint_R f(x, g(x, z), z)\sqrt{1 + [g_x(x, z)]^2 + [g_z(x, z)]^2}\,dA.$$

If S is the graph of $x = g(y, z)$, and R is its projection onto the yz-plane, then

$$\iint_S f(x, y, z)\,dS = \iint_R f(g(y, z), y, z)\sqrt{1 + [g_y(y, z)]^2 + [g_z(y, z)]^2}\,dA.$$

If $f(x, y, z) = 1$, the surface integral over S yields the surface area of S. For instance, suppose the surface S is the plane given by $z = x$, where $0 \le x \le 1$ and $0 \le y \le 1$. The surface area of S is $\sqrt{2}$ square units. Try verifying that

$$\iint_S f(x, y, z)\,dS = \sqrt{2}.$$

GO DIGITAL

EXAMPLE 1 Evaluating a Surface Integral

Evaluate the surface integral

$$\iint_S (y^2 + 2yz)\, dS$$

where S is the first-octant portion of the plane

$$2x + y + 2z = 6.$$

Solution Begin by writing S as

$$z = g(x, y) = \frac{1}{2}(6 - 2x - y).$$

Using the partial derivatives $g_x(x, y) = -1$ and $g_y(x, y) = -\frac{1}{2}$, you can write

$$\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2} = \sqrt{1 + 1 + \frac{1}{4}} = \frac{3}{2}.$$

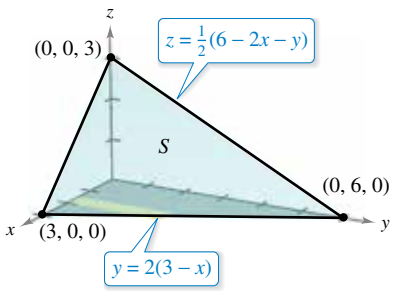

Figure 15.45

Using Figure 15.45 and Theorem 15.10, you obtain

$$\begin{aligned}
\iint_S (y^2 + 2yz)\, dS &= \iint_R f(x, y, g(x, y))\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}\, dA \\
&= \iint_R \left[y^2 + 2y\left(\frac{1}{2}\right)(6 - 2x - y)\right]\left(\frac{3}{2}\right) dA \\
&= 3\int_0^3 \int_0^{2(3-x)} y(3 - x)\, dy\, dx && \text{Convert to iterated integral.} \\
&= 3\int_0^3 \frac{y^2}{2}(3 - x)\Big]_0^{2(3-x)}\, dx && \text{Integrate with respect to } y. \\
&= 6\int_0^3 (3 - x)^3\, dx \\
&= -\frac{3}{2}(3 - x)^4\Big]_0^3 && \text{Integrate with respect to } x. \\
&= \frac{243}{2}.
\end{aligned}$$

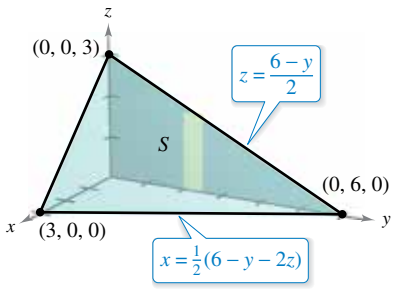

Figure 15.46

An alternative solution to Example 1 would be to project S onto the yz-plane, as shown in Figure 15.46. Then $x = \frac{1}{2}(6 - y - 2z)$, and

$$\sqrt{1 + [g_y(y, z)]^2 + [g_z(y, z)]^2} = \sqrt{1 + \frac{1}{4} + 1} = \frac{3}{2}.$$

So, the surface integral is

$$\begin{aligned}
\iint_S (y^2 + 2yz)\, dS &= \iint_R f(g(y, z), y, z)\sqrt{1 + [g_y(y, z)]^2 + [g_z(y, z)]^2}\, dA \\
&= \int_0^6 \int_0^{(6-y)/2} (y^2 + 2yz)\left(\frac{3}{2}\right) dz\, dy \\
&= \frac{3}{8}\int_0^6 (36y - y^3)\, dy \\
&= \frac{243}{2}.
\end{aligned}$$

Try reworking Example 1 by projecting S onto the xz-plane.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

GO DIGITAL

In Example 1, you could have projected the surface S onto any one of the three coordinate planes. In Example 2, S is a portion of a cylinder centered about the x-axis, and you can project it onto either the xz-plane or the xy-plane.

EXAMPLE 2 Evaluating a Surface Integral

See LarsonCalculus.com for an interactive version of this type of example.

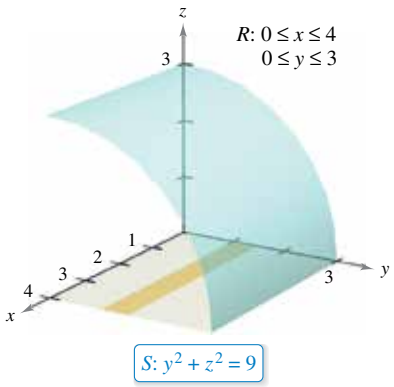

Figure 15.47

Evaluate the surface integral

$$\iint_S (x + z)\, dS$$

where S is the first-octant portion of the cylinder

$$y^2 + z^2 = 9$$

between $x = 0$ and $x = 4$, as shown in Figure 15.47.

Solution Project S onto the xy-plane so that

$$z = g(x, y) = \sqrt{9 - y^2}$$

and obtain

$$\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2} = \sqrt{1 + \left(\frac{-y}{\sqrt{9 - y^2}}\right)^2} = \frac{3}{\sqrt{9 - y^2}}.$$

Theorem 15.10 does not apply directly, because g_y is not continuous when $y = 3$. However, you can apply Theorem 15.10 for $0 \le b < 3$ and then take the limit as b approaches 3, as follows.

$$\begin{aligned}
\iint_S (x + z)\, dS &= \lim_{b \to 3^-} \int_0^b \int_0^4 \left(x + \sqrt{9 - y^2}\right) \frac{3}{\sqrt{9 - y^2}}\, dx\, dy \\
&= \lim_{b \to 3^-} 3 \int_0^b \int_0^4 \left(\frac{x}{\sqrt{9 - y^2}} + 1\right) dx\, dy \\
&= \lim_{b \to 3^-} 3 \int_0^b \left[\frac{x^2}{2\sqrt{9 - y^2}} + x\right]_0^4 dy && \text{Integrate with respect to } x. \\
&= \lim_{b \to 3^-} 3 \int_0^b \left(\frac{8}{\sqrt{9 - y^2}} + 4\right) dy \\
&= \lim_{b \to 3^-} 3 \left[4y + 8 \arcsin \frac{y}{3}\right]_0^b && \text{Integrate with respect to } y. \\
&= \lim_{b \to 3^-} 3 \left(4b + 8 \arcsin \frac{b}{3}\right) \\
&= 36 + 24\left(\frac{\pi}{2}\right) && \text{Evaluate limit.} \\
&= 36 + 12\pi
\end{aligned}$$

TECHNOLOGY Some graphing utilities are capable of evaluating improper integrals. If you have access to a graphing utility with this feature, use it to evaluate the improper integral

$$\int_0^3 \int_0^4 \left(x + \sqrt{9 - y^2}\right) \frac{3}{\sqrt{9 - y^2}}\, dx\, dy.$$

Do you obtain the same result as in Example 2?

GO DIGITAL

You have already learned that when the function f defined on the surface S is simply $f(x, y, z) = 1$, the surface integral yields the *surface area* of S.

$$\text{Area of surface} = \iint_S 1 \, dS$$

If S is a lamina of variable density and $\rho(x, y, z)$ is the density at the point (x, y, z), then the *mass* of the lamina is given by

$$\text{Mass of lamina} = \iint_S \rho(x, y, z) \, dS.$$

EXAMPLE 3 Finding the Mass of a Surface Lamina

A cone-shaped surface lamina S is given by

$$z = 4 - 2\sqrt{x^2 + y^2}, \quad 0 \le z \le 4$$

as shown in Figure 15.48. At each point on S, the density is proportional to the distance between the point and the z-axis. Find the mass m of the lamina.

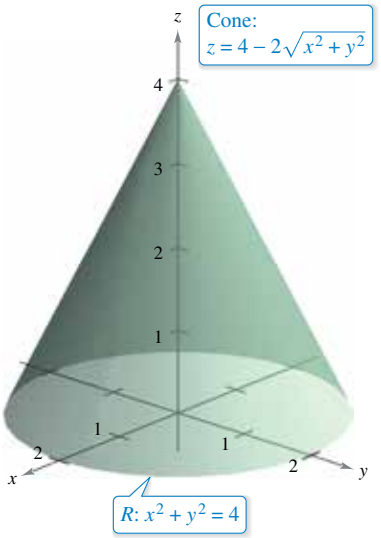

Figure 15.48

Solution Projecting S onto the xy-plane produces

$$S: \; z = 4 - 2\sqrt{x^2 + y^2} = g(x, y), \quad 0 \le z \le 4$$
$$R: \; x^2 + y^2 \le 4$$

with a density of

$$\rho(x, y, z) = k\sqrt{x^2 + y^2}$$

where k is the constant of proportionality. Using a surface integral, you can find the mass to be

$$\begin{aligned}
m &= \iint_S \rho(x, y, z) \, dS \\
&= \iint_R k\sqrt{x^2 + y^2}\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2} \, dA \\
&= k\iint_R \sqrt{x^2 + y^2}\sqrt{1 + \frac{4x^2}{x^2 + y^2} + \frac{4y^2}{x^2 + y^2}} \, dA \\
&= k\iint_R \sqrt{5}\sqrt{x^2 + y^2} \, dA \\
&= k\int_0^{2\pi}\int_0^2 \left(\sqrt{5}r\right) r \, dr \, d\theta \qquad \text{Polar coordinates} \\
&= \frac{\sqrt{5}k}{3}\int_0^{2\pi} r^3\Big]_0^2 \, d\theta \qquad \text{Integrate with respect to } r. \\
&= \frac{8\sqrt{5}k}{3}\int_0^{2\pi} d\theta \\
&= \frac{8\sqrt{5}k}{3}\Big[\theta\Big]_0^{2\pi} \qquad \text{Integrate with respect to } \theta. \\
&= \frac{16\sqrt{5}k\pi}{3}.
\end{aligned}$$

TECHNOLOGY Use a graphing utility to confirm the result shown in Example 3.

Parametric Surfaces and Surface Integrals

For a surface S given by the vector-valued function

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$ Parametric surface

defined over a region D in the uv-plane, it can be shown that the surface integral of $f(x, y, z)$ over S is given by

$$\iint_S f(x, y, z)\, dS = \iint_D f(x(u, v), y(u, v), z(u, v))\|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\|\, dA.$$

Note the similarity to a line integral over a space curve C.

$$\int_C f(x, y, z)\, ds = \int_a^b f(x(t), y(t), z(t))\|\mathbf{r}'(t)\|\, dt$$ Line integral

Also, notice that ds and dS can be written as

$$ds = \|\mathbf{r}'(t)\|\, dt \quad \text{and} \quad dS = \|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\|\, dA.$$

EXAMPLE 4 Evaluating a Surface Integral

Example 2 demonstrated an evaluation of the surface integral

$$\iint_S (x + z)\, dS$$

where S is the first-octant portion of the cylinder

$$y^2 + z^2 = 9$$

between $x = 0$ and $x = 4$, as shown in Figure 15.49. Reevaluate this integral in parametric form.

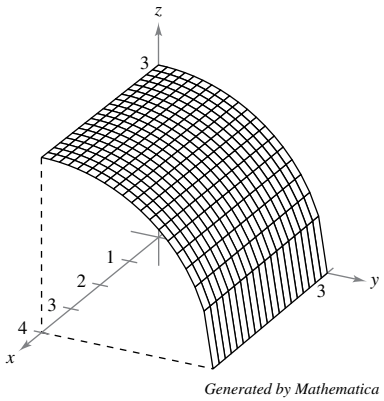

Figure 15.49

Solution In parametric form, the surface is given by

$$\mathbf{r}(x, \theta) = x\mathbf{i} + 3\cos\theta\mathbf{j} + 3\sin\theta\mathbf{k}$$

where $0 \le x \le 4$ and $0 \le \theta \le \pi/2$. To evaluate the surface integral in parametric form, begin by calculating the following.

$$\mathbf{r}_x = \mathbf{i}$$

$$\mathbf{r}_\theta = -3\sin\theta\mathbf{j} + 3\cos\theta\mathbf{k}$$

$$\mathbf{r}_x \times \mathbf{r}_\theta = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & 0 \\ 0 & -3\sin\theta & 3\cos\theta \end{vmatrix} = -3\cos\theta\mathbf{j} - 3\sin\theta\mathbf{k}$$

$$\|\mathbf{r}_x \times \mathbf{r}_\theta\| = \sqrt{9\cos^2\theta + 9\sin^2\theta} = 3$$

So, the surface integral can be evaluated as follows.

$$\begin{aligned} \iint_D (x + 3\sin\theta)3\, dA &= \int_0^4 \int_0^{\pi/2} (3x + 9\sin\theta)\, d\theta\, dx \\ &= \int_0^4 \left[3x\theta - 9\cos\theta\right]_0^{\pi/2} dx \\ &= \int_0^4 \left(\frac{3\pi}{2}x + 9\right) dx \\ &= \left[\frac{3\pi}{4}x^2 + 9x\right]_0^4 \\ &= 12\pi + 36 \end{aligned}$$

Orientation of a Surface

Unit normal vectors are used to induce an orientation to a surface S in space. A surface is **orientable** when a unit normal vector $\mathbf{N}$ can be defined at every nonboundary point of S in such a way that the normal vectors vary continuously over the surface S. The surface S is called an **oriented surface.**

An orientable surface S has two distinct sides. So, when you orient a surface, you are selecting one of the two possible unit normal vectors. For a closed surface such as a sphere, it is customary to choose the unit normal vector $\mathbf{N}$ to be the one that points outward from the sphere.

Most common surfaces, such as spheres, paraboloids, ellipses, and planes, are orientable. (See Exercise 43 for an example of a surface that is *not* orientable.) Moreover, for an orientable surface, the gradient provides a convenient way to find a unit normal vector. That is, for an orientable surface S given by

$$z = g(x, y)$$ Orientable surface

let

$$G(x, y, z) = z - g(x, y).$$

Then, S can be oriented by either the unit normal vector

$$\mathbf{N} = \frac{\nabla G(x, y, z)}{\|\nabla G(x, y, z)\|} = \frac{-g_x(x, y)\mathbf{i} - g_y(x, y)\mathbf{j} + \mathbf{k}}{\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}}$$ Upward unit normal vector

or the unit normal vector

$$\mathbf{N} = \frac{-\nabla G(x, y, z)}{\|\nabla G(x, y, z)\|} = \frac{g_x(x, y)\mathbf{i} + g_y(x, y)\mathbf{j} - \mathbf{k}}{\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}}$$ Downward unit normal vector

as shown in Figure 15.50. If the smooth orientable surface S is given in parametric form by

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$ Parametric surface

then the unit normal vectors are given by

$$\mathbf{N} = \frac{\mathbf{r}_u \times \mathbf{r}_v}{\|\mathbf{r}_u \times \mathbf{r}_v\|}$$ Upward unit normal vector

and

$$\mathbf{N} = \frac{\mathbf{r}_v \times \mathbf{r}_u}{\|\mathbf{r}_v \times \mathbf{r}_u\|}.$$ Downward unit normal vector

For an orientable surface given by

$$y = g(x, z) \quad \text{or} \quad x = g(y, z)$$

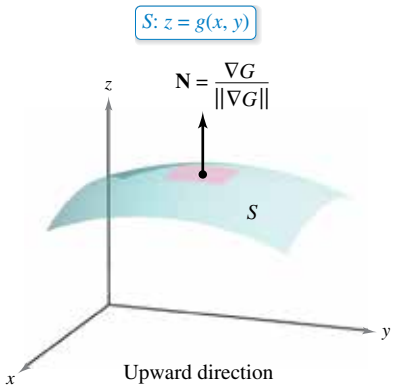
you can use the gradient

$$\nabla G(x, y, z) = -g_x(x, z)\mathbf{i} + \mathbf{j} - g_z(x, z)\mathbf{k}$$ $G(x, y, z) = y - g(x, z)$

or

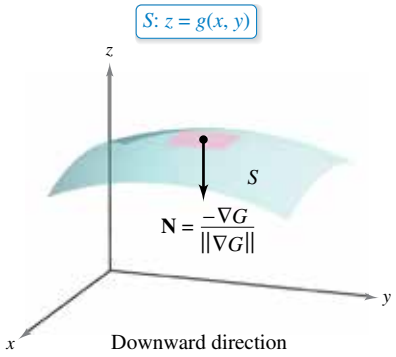
$$\nabla G(x, y, z) = \mathbf{i} - g_y(y, z)\mathbf{j} - g_z(y, z)\mathbf{k}$$ $G(x, y, z) = x - g(y, z)$

to orient the surface.



Upward direction

S is oriented in an upward direction.



Downward direction

S is oriented in a downward direction.

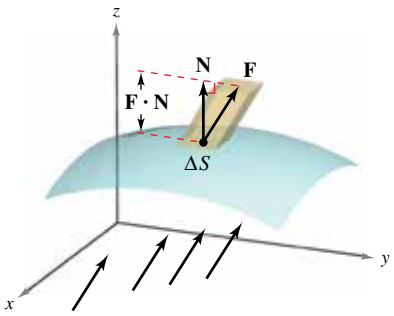
Flux Integrals



The velocity field **F** indicates the direction of the fluid flow.
Figure 15.51

One of the principal applications involving the vector form of a surface integral relates to the flow of a fluid through a surface. Consider an oriented surface S submerged in a fluid having a continuous velocity field $\mathbf{F}$. Let ΔS be the area of a small patch of the surface S over which $\mathbf{F}$ is nearly constant. Then the amount of fluid crossing this region per unit of time is approximated by the volume of the column of height $\mathbf{F} \cdot \mathbf{N}$, as shown in Figure 15.51. That is,

$$\begin{aligned}\Delta V &= (\text{height})(\text{area of base}) \\ &= (\mathbf{F} \cdot \mathbf{N})\, \Delta S.\end{aligned}$$

Consequently, the volume of fluid crossing the surface S per unit of time (called the **flux of F across *S***) is given by the surface integral in the next definition.

Definition of Flux Integral

Let $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$, where M, N, and P have continuous first partial derivatives on the surface S oriented by a unit normal vector $\mathbf{N}$. The **flux integral of F across *S*** is given by

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS.$$

Geometrically, a flux integral is the surface integral over S of the *normal component* of $\mathbf{F}$. If $\rho(x, y, z)$ is the density of the fluid at (x, y, z), then the flux integral

$$\iint_S \rho \mathbf{F} \cdot \mathbf{N}\, dS$$

represents the *mass* of the fluid flowing across S per unit of time.

To evaluate a flux integral for a surface given by $z = g(x, y)$, let

$$G(x, y, z) = z - g(x, y).$$

Then $\mathbf{N}\, dS$ can be written as follows.

$$\begin{aligned}\mathbf{N}\, dS &= \frac{\nabla G(x, y, z)}{\|\nabla G(x, y, z)\|}\, dS \\ &= \frac{\nabla G(x, y, z)}{\sqrt{(g_x)^2 + (g_y)^2 + 1}} \sqrt{(g_x)^2 + (g_y)^2 + 1}\, dA \\ &= \nabla G(x, y, z)\, dA\end{aligned}$$

THEOREM 15.11 Evaluating a Flux Integral

Let S be an oriented surface given by $z = g(x, y)$, and let R be its projection onto the xy-plane.

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_R \mathbf{F} \cdot [-g_x(x, y)\mathbf{i} - g_y(x, y)\mathbf{j} + \mathbf{k}]\, dA \qquad \text{Oriented upward}$$

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_R \mathbf{F} \cdot [g_x(x, y)\mathbf{i} + g_y(x, y)\mathbf{j} - \mathbf{k}]\, dA \qquad \text{Oriented downward}$$

For the first integral, the surface is oriented upward, and for the second integral, the surface is oriented downward.

EXAMPLE 5 Using a Flux Integral to Find the Rate of Mass Flow

Let S be the portion of the paraboloid

$$z = g(x, y) = 4 - x^2 - y^2$$

lying above the xy-plane, oriented by an upward unit normal vector, as shown in Figure 15.52. A fluid of constant density ρ is flowing through the surface S according to the vector field

$$\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}.$$

Find the rate of mass flow through S.

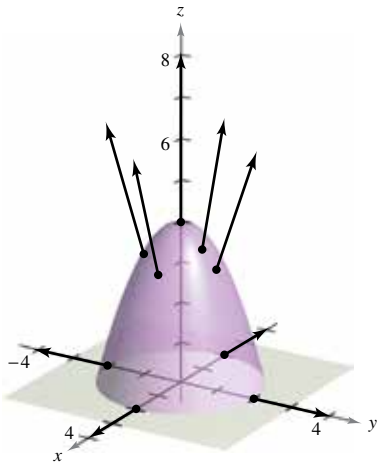

Figure 15.52

Solution Note that S is oriented upward and the partial derivatives of g are

$$g_x(x, y) = -2x$$

and

$$g_y(x, y) = -2y.$$

So, the rate of mass flow through the surface S is

$$\begin{aligned}
\iint_S \rho\mathbf{F} \cdot \mathbf{N}\, dS &= \rho \iint_R \mathbf{F} \cdot [-g_x(x, y)\mathbf{i} - g_y(x, y)\mathbf{j} + \mathbf{k}]\, dA \\
&= \rho \iint_R [x\mathbf{i} + y\mathbf{j} + (4 - x^2 - y^2)\mathbf{k}] \cdot (2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k})\, dA \\
&= \rho \iint_R [2x^2 + 2y^2 + (4 - x^2 - y^2)]\, dA \\
&= \rho \iint_R (4 + x^2 + y^2)\, dA \\
&= \rho \int_0^{2\pi} \int_0^2 (4 + r^2) r\, dr\, d\theta \qquad \text{Polar coordinates} \\
&= \rho \int_0^{2\pi} \left[2r^2 + \frac{r^4}{4} \right]_0^2 d\theta \\
&= \rho \int_0^{2\pi} 12\, d\theta \\
&= 24\pi\rho.
\end{aligned}$$

For an oriented upward surface S given by the vector-valued function

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k} \qquad \text{Parametric surface}$$

defined over a region D in the uv-plane, you can define the flux integral of $\mathbf{F}$ across S as

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_D \mathbf{F} \cdot \left(\frac{\mathbf{r}_u \times \mathbf{r}_v}{\|\mathbf{r}_u \times \mathbf{r}_v\|} \right) \|\mathbf{r}_u \times \mathbf{r}_v\|\, dA = \iint_D \mathbf{F} \cdot (\mathbf{r}_u \times \mathbf{r}_v)\, dA.$$

Note the similarity of this integral to the line integral

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \mathbf{F} \cdot \mathbf{T}\, ds.$$

A summary of formulas for line and surface integrals is presented on page 1107.

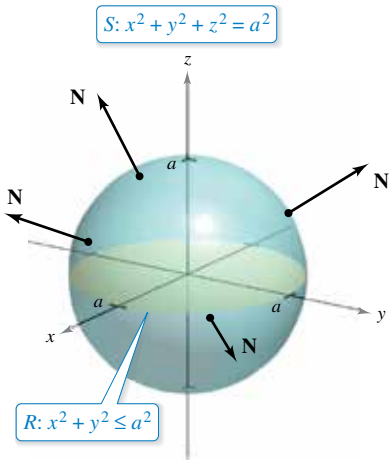

Figure 15.53

EXAMPLE 6 Finding the Flux of an Inverse Square Field

Find the flux over the sphere S given by

$$x^2 + y^2 + z^2 = a^2 \qquad \text{Sphere } S$$

where $\mathbf{F}$ is an inverse square field given by

$$\mathbf{F}(x, y, z) = \frac{kq}{\|\mathbf{r}\|^2}\frac{\mathbf{r}}{\|\mathbf{r}\|} = \frac{kq\mathbf{r}}{\|\mathbf{r}\|^3} \qquad \text{Inverse square field } \mathbf{F}$$

and

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}.$$

Assume S is oriented outward, as shown in Figure 15.53.

Solution The sphere is given by

$$\begin{aligned}\mathbf{r}(u, v) &= x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k} \\ &= a \sin u \cos v\mathbf{i} + a \sin u \sin v\mathbf{j} + a \cos u\mathbf{k}\end{aligned}$$

where $0 \le u \le \pi$ and $0 \le v \le 2\pi$. The partial derivatives of $\mathbf{r}$ are

$$\mathbf{r}_u(u, v) = a \cos u \cos v\mathbf{i} + a \cos u \sin v\mathbf{j} - a \sin u\mathbf{k}$$

and

$$\mathbf{r}_v(u, v) = -a \sin u \sin v\mathbf{i} + a \sin u \cos v\mathbf{j}$$

which implies that the normal vector $\mathbf{r}_u \times \mathbf{r}_v$ is

$$\begin{aligned}\mathbf{r}_u \times \mathbf{r}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a \cos u \cos v & a \cos u \sin v & -a \sin u \\ -a \sin u \sin v & a \sin u \cos v & 0 \end{vmatrix} \\ &= a^2(\sin^2 u \cos v\mathbf{i} + \sin^2 u \sin v\mathbf{j} + \sin u \cos u\mathbf{k}).\end{aligned}$$

Now, using

$$\begin{aligned}\mathbf{F}(x, y, z) &= \frac{kq\mathbf{r}}{\|\mathbf{r}\|^3} \\ &= kq\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\|x\mathbf{i} + y\mathbf{j} + z\mathbf{k}\|^3} \\ &= \frac{kq}{a^3}(a \sin u \cos v\mathbf{i} + a \sin u \sin v\mathbf{j} + a \cos u\mathbf{k})\end{aligned}$$

it follows that

$$\begin{aligned}\mathbf{F} \cdot (\mathbf{r}_u \times \mathbf{r}_v) &= \frac{kq}{a^3}[(a \sin u \cos v\mathbf{i} + a \sin u \sin v\mathbf{j} + a \cos u\mathbf{k}) \cdot \\ &\qquad a^2(\sin^2 u \cos v\mathbf{i} + \sin^2 u \sin v\mathbf{j} + \sin u \cos u\mathbf{k})] \\ &= kq(\sin^3 u \cos^2 v + \sin^3 u \sin^2 v + \sin u \cos^2 u) \\ &= kq \sin u.\end{aligned}$$

Finally, the flux over the sphere S is given by

$$\begin{aligned}\iint_S \mathbf{F} \cdot \mathbf{N}\, dS &= \iint_D kq \sin u\, dA \\ &= kq\int_0^{2\pi}\int_0^{\pi} \sin u\, du\, dv \\ &= kq\int_0^{2\pi} 2\, dv \\ &= 4\pi kq.\end{aligned}$$

The result in Example 6 shows that the flux across a sphere S in an inverse square field is independent of the radius of S. In particular, if $\mathbf{E}$ is an electric field, then the result in Example 6, along with Coulomb's Law (see Section 15.1), yields one of the basic laws of electrostatics, known as **Gauss's Law:**

$$\iint_S \mathbf{E} \cdot \mathbf{N}\, dS = 4\pi kq \qquad \text{Gauss's Law}$$

where q is a point charge located at the center of the sphere and k is the Coulomb constant. Gauss's Law is valid for more general closed surfaces that enclose the origin, and it relates the flux out of the surface to the total charge inside the surface.

Surface integrals are also used in the study of **heat flow.** Heat flows from areas of higher temperature to areas of lower temperature in the direction of greatest change. As a result, measuring **heat flux** involves the gradient of the temperature. The flux depends on the area of the surface. It is the normal direction to the surface that is important, because heat that flows in directions tangential to the surface will produce no heat loss. So, assume that the heat flux across a portion of the surface of area ΔS is given by $\Delta H \approx -k\nabla T \cdot \mathbf{N}\, dS$, where T is the temperature, $\mathbf{N}$ is the unit normal vector to the surface in the direction of the heat flow, and k is the thermal diffusivity of the material. The heat flux across the surface is given by

$$H = \iint_S -k\nabla T \cdot \mathbf{N}\, dS. \qquad \text{Heat flux across } S$$

This section concludes with a summary of different forms of line integrals and surface integrals.

Summary of Line and Surface Integrals

Line Integrals

$$ds = \|\mathbf{r}'(t)\|\, dt = \sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\, dt$$

$$\int_C f(x, y, z)\, ds = \int_a^b f(x(t), y(t), z(t))\sqrt{[x'(t)]^2 + [y'(t)]^2 + [z'(t)]^2}\, dt \qquad \text{Scalar form}$$

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \mathbf{F} \cdot \mathbf{T}\, ds = \int_a^b \mathbf{F}(x(t), y(t), z(t)) \cdot \mathbf{r}'(t)\, dt \qquad \text{Vector form}$$

Surface Integrals $[z = g(x, y)]$

$$dS = \sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}\, dA$$

$$\iint_S f(x, y, z)\, dS = \iint_R f(x, y, g(x, y))\sqrt{1 + [g_x(x, y)]^2 + [g_y(x, y)]^2}\, dA \qquad \text{Scalar form}$$

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_R \mathbf{F} \cdot [-g_x(x, y)\mathbf{i} - g_y(x, y)\mathbf{j} + \mathbf{k}]\, dA \qquad \text{Vector form (upward normal)}$$

Surface Integrals (parametric form)

$$dS = \|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\|\, dA$$

$$\iint_S f(x, y, z)\, dS = \iint_D f(x(u, v), y(u, v), z(u, v))\|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\|\, dA \qquad \text{Scalar form}$$

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_D \mathbf{F} \cdot (\mathbf{r}_u \times \mathbf{r}_v)\, dA \qquad \text{Vector form (upward normal)}$$

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how to set up a surface integral given that you will project the surface onto the xz-plane.
2. For what condition does the surface integral over S yield the surface area of S?
3. Describe a physical characteristic of an orientable surface.
4. What is the physical interpretation of the flux of $\mathbf{F}$ across S? How do you calculate it?

Evaluating a Surface Integral In Exercises 5–8, evaluate $\iint_S (x - 2y + z)\, dS$.

5. S: $z = 4 - x$, $0 \le x \le 4$, $0 \le y \le 3$
6. S: $z = 15 - 2x + 3y$, $0 \le x \le 2$, $0 \le y \le 4$
7. S: $z = 2$, $x^2 + y^2 \le 1$
8. S: $z = 3y$, $0 \le x \le 2$, $0 \le y \le x$

Evaluating a Surface Integral In Exercises 9 and 10, evaluate $\iint_S xy\, dS$.

9. S: $z = 3 - x - y$, first octant
10. S: $z = \frac{1}{4}x^4$, $0 \le x \le 1$, $0 \le y \le x^2$

Evaluating a Surface Integral In Exercises 11 and 12, use a graphing utility to evaluate $\iint_S (x^2 - 2xy)\, dS$.

11. S: $z = 10 - x^2 - y^2$, $0 \le x \le 2$, $0 \le y \le 2$
12. S: $z = \cos x$, $0 \le x \le \frac{\pi}{2}$, $0 \le y \le \frac{1}{2}x$

Mass In Exercises 13 and 14, find the mass of the surface lamina S of density ρ.

13. S: $2x + 3y + 6z = 12$, first octant, $\rho(x, y, z) = x^2 + y^2$
14. S: $z = \sqrt{a^2 - x^2 - y^2}$, $\rho(x, y, z) = kz$

Evaluating a Surface Integral In Exercises 15–18, evaluate $\iint_S f(x, y)\, dS$.

15. $f(x, y) = y + 5$
    S: $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + 2v\mathbf{k}$
    $0 \le u \le 1$, $0 \le v \le 2$
16. $f(x, y) = xy$
    S: $\mathbf{r}(u, v) = 2\cos u\mathbf{i} + 2\sin u\mathbf{j} + v\mathbf{k}$
    $0 \le u \le \frac{\pi}{2}$, $0 \le v \le 1$
17. $f(x, y) = 3y - x$
    S: $\mathbf{r}(u, v) = \cos u\mathbf{i} + \sin u\mathbf{j} + v\mathbf{k}$
    $0 \le u \le \frac{\pi}{3}$, $0 \le v \le 1$
18. $f(x, y) = x + y$
    S: $\mathbf{r}(u, v) = 4u\cos v\mathbf{i} + 4u\sin v\mathbf{j} + 3u\mathbf{k}$
    $0 \le u \le 4$, $0 \le v \le \pi$

Evaluating a Surface Integral In Exercises 19–24, evaluate $\iint_S f(x, y, z)\, dS$.

19. $f(x, y, z) = x^2 + y^2 + z^2$
    S: $z = x + y$, $x^2 + y^2 \le 1$
20. $f(x, y, z) = \dfrac{xy}{z}$
    S: $z = x^2 + y^2$, $4 \le x^2 + y^2 \le 16$
21. $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$
    S: $z = \sqrt{x^2 + y^2}$, $x^2 + y^2 \le 4$
22. $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$
    S: $z = \sqrt{x^2 + y^2}$, $(x - 1)^2 + y^2 \le 1$
23. $f(x, y, z) = x^2 + y^2 + z^2$
    S: $x^2 + y^2 = 9$, $0 \le x \le 3$, $0 \le y \le 3$, $0 \le z \le 9$
24. $f(x, y, z) = x^2 + y^2 + z^2$
    S: $x^2 + y^2 = 9$, $0 \le x \le 3$, $0 \le z \le x$

Evaluating a Flux Integral In Exercises 25–30, find the flux of $\mathbf{F}$ across S,

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$$

where $\mathbf{N}$ is the upward unit normal vector to S.

25. $\mathbf{F}(x, y, z) = 3z\mathbf{i} - 4\mathbf{j} + y\mathbf{k}$; S: $z = 1 - x - y$, first octant
26. $\mathbf{F}(x, y, z) = x\mathbf{i} + 2y\mathbf{j}$; S: $z = 6 - 3x - 2y$, first octant
27. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$; S: $z = 1 - x^2 - y^2$, $z \ge 0$
28. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
    S: $x^2 + y^2 + z^2 = 36$, first octant
29. $\mathbf{F}(x, y, z) = 4\mathbf{i} - 3\mathbf{j} + 5\mathbf{k}$
    S: $z = x^2 + y^2$, $x^2 + y^2 \le 4$
30. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} - 2z\mathbf{k}$
    S: $z = \sqrt{a^2 - x^2 - y^2}$

Evaluating a Flux Integral In Exercises 31 and 32, find the flux of $\mathbf{F}$ over the closed surface. (Let $\mathbf{N}$ be the outward unit normal vector of the surface.)

31. $\mathbf{F}(x, y, z) = (x + y)\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
    S: $z = 16 - x^2 - y^2$, $z = 0$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

32. $\mathbf{F}(x, y, z) = 4xy\mathbf{i} + z^2\mathbf{j} + yz\mathbf{k}$

S: unit cube bounded by the planes $x = 0$, $x = 1$, $y = 0$, $y = 1$, $z = 0$, $z = 1$

Flow Rate **In Exercises 33 and 34, use a graphing utility to find the rate of mass flow of a fluid of density ρ through the surface S oriented upward when the velocity field is given by $\mathbf{F}(x, y, z) = 0.5z\mathbf{k}$.**

33. S: $z = 16 - x^2 - y^2, \quad z \geq 0$

34. S: $z = \sqrt{16 - x^2 - y^2}$

Gauss's Law **In Exercises 35 and 36, evaluate $\iint_S \mathbf{E} \cdot \mathbf{N}\, dS$ to find the total charge of the electrostatic field $\mathbf{E}$ enclosed by the closed surface consisting of the hemisphere $z = \sqrt{1 - x^2 - y^2}$ and its circular base in the xy-plane.**

35. $\mathbf{E} = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$

36. $\mathbf{E} = x\mathbf{i} + y\mathbf{j} + 2z\mathbf{k}$

Moments of Inertia **In Exercises 37–40, use the following formulas for the moments of inertia about the coordinate axes of a surface lamina of density ρ.**

$$I_x = \iint_S (y^2 + z^2)\rho(x, y, z)\, dS$$

$$I_y = \iint_S (x^2 + z^2)\rho(x, y, z)\, dS$$

$$I_z = \iint_S (x^2 + y^2)\rho(x, y, z)\, dS$$

37. Verify that the moment of inertia of a conical shell of uniform density about its axis is $\frac{1}{2}ma^2$, where m is the mass and a is the radius and height.

38. Verify that the moment of inertia of a spherical shell of uniform density about its diameter is $\frac{2}{3}ma^2$, where m is the mass and a is the radius.

39. Find the moment of inertia about the z-axis for the surface lamina $x^2 + y^2 = a^2$, where $0 \leq z \leq h$, with a uniform density of 1.

40. Find the moment of inertia about the z-axis for the surface lamina $z = x^2 + y^2$, where $0 \leq z \leq h$, with a uniform density of 1.

Exploring Concepts

41. Evaluate

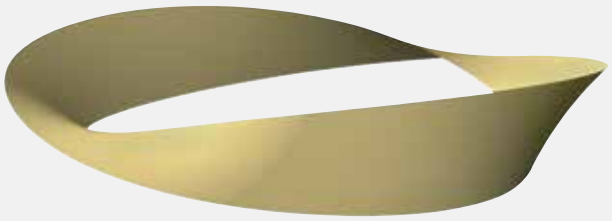
$$\iint_S (x + 2y)\, dS$$

where S is the first-octant portion of the plane

$$2x + 2y + z = 4$$

by projecting S onto (a) the xy-plane, (b) the xz-plane, and (c) the yz-plane. Verify that all answers are the same.

42. **HOW DO YOU SEE IT?** Is the surface shown in the figure orientable? Explain why or why not.



Double twist

43. **Investigation**

(a) Use a graphing utility to graph the vector-valued function

$$\mathbf{r}(u, v) = (4 - v \sin u)\cos(2u)\mathbf{i} + (4 - v \sin u)\sin(2u)\mathbf{j} + v \cos u\mathbf{k}$$

where

$$0 \leq u \leq \pi \quad \text{and} \quad -1 \leq v \leq 1.$$

This surface is called a Möbius strip.

(b) Is the surface orientable? Explain why or why not.

(c) Use a graphing utility to graph the space curve represented by $\mathbf{r}(u, 0)$. Identify the curve.

(d) Cut a strip of paper and draw a line lengthwise through the center. Construct a Möbius strip by making a single twist and pasting the ends of the strip of paper together.

(e) Cut the Möbius strip along the line you drew in part (c), and describe the result.

SECTION PROJECT

Hyperboloid of One Sheet

Consider the parametric surface given by the function

$$\mathbf{r}(u, v) = a \cosh u \cos v\mathbf{i} + a \cosh u \sin v\mathbf{j} + b \sinh u\mathbf{k}.$$

(a) Use a graphing utility to graph $\mathbf{r}$ for various values of the constants a and b. Describe the effect of the constants on the shape of the surface.

(b) Show that the surface is a hyperboloid of one sheet given by

$$\frac{x^2}{a^2} + \frac{y^2}{a^2} - \frac{z^2}{b^2} = 1.$$

(c) For fixed values $u = u_0$, describe the curves given by

$$\mathbf{r}(u_0, v) = a \cosh u_0 \cos v\mathbf{i} + a \cosh u_0 \sin v\mathbf{j} + b \sinh u_0\mathbf{k}.$$

(d) For fixed values $v = v_0$, describe the curves given by

$$\mathbf{r}(u, v_0) = a \cosh u \cos v_0\mathbf{i} + a \cosh u \sin v_0\mathbf{j} + b \sinh u\mathbf{k}.$$

(e) Find a normal vector to the surface at $(u, v) = (0, 0)$.

15.7 Divergence Theorem

GO DIGITAL

- **Define and use the Divergence Theorem.**
- **Use the Divergence Theorem to calculate flux.**

CARL FRIEDRICH GAUSS (1777–1855)

The *Divergence Theorem* is also called *Gauss's Theorem*, after the famous German mathematician Carl Friedrich Gauss. Gauss is recognized, with Newton and Archimedes, as one of the three greatest mathematicians in history. One of his many contributions to mathematics was made at the age of 22, when, as part of his doctoral dissertation, he proved the *Fundamental Theorem of Algebra*.

See LarsonCalculus.com to read more of this biography.

Divergence Theorem

Recall from Section 15.4 that an alternative form of Green's Theorem is

$$\int_C \mathbf{F} \cdot \mathbf{N}\, ds = \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} \right) dA$$
$$= \iint_R \operatorname{div} \mathbf{F}\, dA.$$

In an analogous way, the **Divergence Theorem** gives the relationship between a triple integral over a solid region Q and a surface integral over the surface of Q. In the statement of the theorem, the surface S is **closed** in the sense that it forms the complete boundary of the solid Q. Regions bounded by spheres, ellipsoids, cubes, tetrahedrons, or combinations of these surfaces are typical examples of closed surfaces. Let Q be a solid region on which a triple integral can be evaluated, and let S be a closed surface that is oriented by *outward* unit normal vectors, as shown in Figure 15.54. With these restrictions on S and Q, the Divergence Theorem can be stated as shown below the figure.

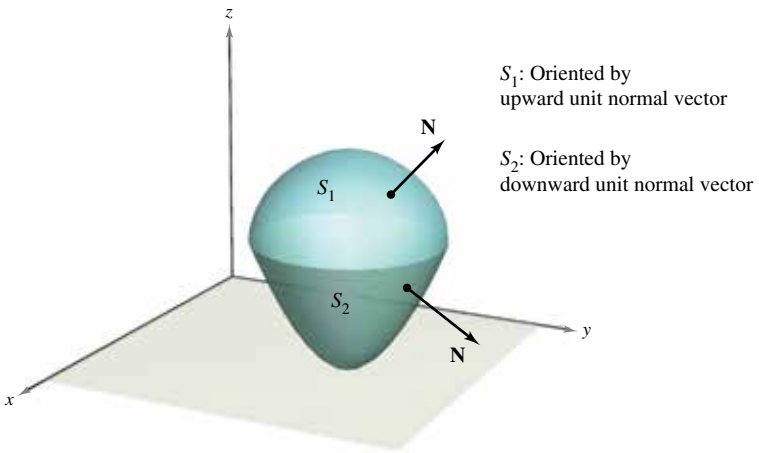

Figure 15.54

THEOREM 15.12 The Divergence Theorem

Let Q be a solid region bounded by a closed surface S oriented by a unit normal vector directed outward from Q. If $\mathbf{F}$ is a vector field whose component functions have continuous first partial derivatives in Q, then

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iiint_Q \operatorname{div} \mathbf{F}\, dV.$$

REMARK As noted at the left above, the Divergence Theorem is sometimes called Gauss's Theorem. It is also sometimes called Ostrogradsky's Theorem, after the Russian mathematician Michel Ostrogradsky (1801–1861).

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

REMARK This proof is restricted to a *simple* solid region. The general proof is best left to a course in advanced calculus.

Proof For $\mathbf{F}(x, y, z) = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$, the theorem takes the form

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iint_S (M\mathbf{i} \cdot \mathbf{N} + N\mathbf{j} \cdot \mathbf{N} + P\mathbf{k} \cdot \mathbf{N})\, dS$$
$$= \iiint_Q \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z} \right) dV.$$

You can prove this by verifying that the following three equations are valid.

$$\iint_S M\mathbf{i} \cdot \mathbf{N}\, dS = \iiint_Q \frac{\partial M}{\partial x}\, dV$$
$$\iint_S N\mathbf{j} \cdot \mathbf{N}\, dS = \iiint_Q \frac{\partial N}{\partial y}\, dV$$
$$\iint_S P\mathbf{k} \cdot \mathbf{N}\, dS = \iiint_Q \frac{\partial P}{\partial z}\, dV$$

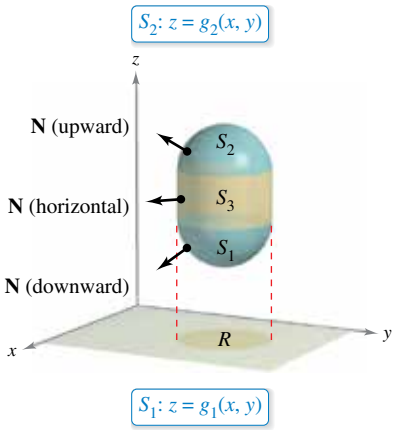

Figure 15.55

Because the verifications of the three equations are similar, only the third is discussed. Restrict the proof to a **simple solid** region with upper surface

$$z = g_2(x, y) \qquad \text{Upper surface}$$

and lower surface

$$z = g_1(x, y) \qquad \text{Lower surface}$$

whose projections onto the xy-plane coincide and form region R. If Q has a lateral surface like S_3 in Figure 15.55, then a normal vector is horizontal, which implies that $P\mathbf{k} \cdot \mathbf{N} = 0$. Consequently, you have

$$\iint_S P\mathbf{k} \cdot \mathbf{N}\, dS = \iint_{S_1} P\mathbf{k} \cdot \mathbf{N}\, dS + \iint_{S_2} P\mathbf{k} \cdot \mathbf{N}\, dS + 0.$$

On the upper surface S_2, the outward normal vector is upward, whereas on the lower surface S_1, the outward normal vector is downward. So, by Theorem 15.11, you have

$$\iint_{S_1} P\mathbf{k} \cdot \mathbf{N}\, dS = \iint_R P(x, y, g_1(x, y))\mathbf{k} \cdot \left(\frac{\partial g_1}{\partial x}\mathbf{i} + \frac{\partial g_1}{\partial y}\mathbf{j} - \mathbf{k} \right) dA$$
$$= -\iint_R P(x, y, g_1(x, y))\, dA$$

and

$$\iint_{S_2} P\mathbf{k} \cdot \mathbf{N}\, dS = \iint_R P(x, y, g_2(x, y))\mathbf{k} \cdot \left(-\frac{\partial g_2}{\partial x}\mathbf{i} - \frac{\partial g_2}{\partial y}\mathbf{j} + \mathbf{k} \right) dA$$
$$= \iint_R P(x, y, g_2(x, y))\, dA.$$

Adding these results, you obtain

$$\iint_S P\mathbf{k} \cdot \mathbf{N}\, dS = \iint_R [P(x, y, g_2(x, y)) - P(x, y, g_1(x, y))]\, dA$$
$$= \iint_R \left[\int_{g_1(x, y)}^{g_2(x, y)} \frac{\partial P}{\partial z}\, dz \right] dA$$
$$= \iiint_Q \frac{\partial P}{\partial z}\, dV.$$

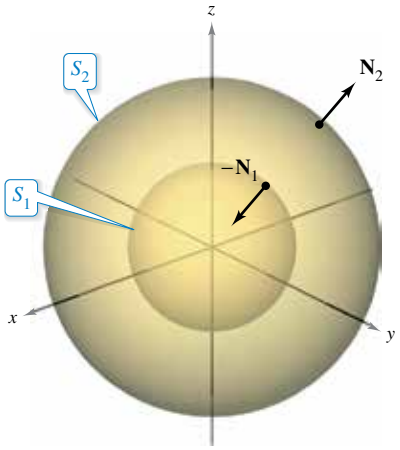

Figure 15.56

Even though the Divergence Theorem was stated for a simple solid region Q bounded by a closed surface, the theorem is also valid for regions that are the finite unions of simple solid regions. For example, let Q be the solid bounded by the closed surfaces S_1 and S_2, as shown in Figure 15.56. To apply the Divergence Theorem to this solid, let $S = S_1 \cup S_2$. The normal vector $\mathbf{N}$ to S is given by $-\mathbf{N}_1$ on S_1 and by $\mathbf{N}_2$ on S_2. So, you can write

$$\begin{aligned}\iiint_Q \operatorname{div} \mathbf{F}\, dV &= \iint_S \mathbf{F} \cdot \mathbf{N}\, dS \\ &= \iint_{S_1} \mathbf{F} \cdot (-\mathbf{N}_1)\, dS + \iint_{S_2} \mathbf{F} \cdot \mathbf{N}_2\, dS \\ &= -\iint_{S_1} \mathbf{F} \cdot \mathbf{N}_1\, dS + \iint_{S_2} \mathbf{F} \cdot \mathbf{N}_2\, dS.\end{aligned}$$

For the remainder of this section, you will apply the Divergence Theorem to simple solid regions bounded by closed surfaces.

EXAMPLE 1 Using the Divergence Theorem

Let Q be the solid region bounded by the coordinate planes and the plane

$$2x + 2y + z = 6$$

and let $\mathbf{F} = x\mathbf{i} + y^2\mathbf{j} + z\mathbf{k}$. Find $\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$, where S is the surface of Q.

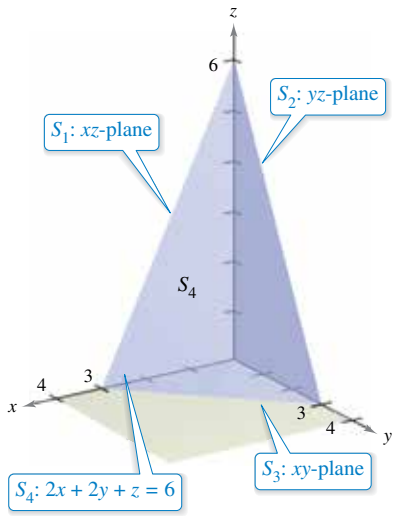

Figure 15.57

Solution From Figure 15.57, note that Q is bounded by four subsurfaces. So, you would need four *surface integrals* to evaluate

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS.$$

However, by the Divergence Theorem, you need only one triple integral. Because

$$\operatorname{div} \mathbf{F} = \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z} = 1 + 2y + 1 = 2 + 2y$$

you have

$$\begin{aligned}\iint_S \mathbf{F} \cdot \mathbf{N}\, dS &= \iiint_Q \operatorname{div} \mathbf{F}\, dV \\ &= \int_0^3 \int_0^{3-y} \int_0^{6-2x-2y} (2 + 2y)\, dz\, dx\, dy \\ &= \int_0^3 \int_0^{3-y} (2z + 2yz) \Big]_0^{6-2x-2y} dx\, dy \\ &= \int_0^3 \int_0^{3-y} (12 - 4x + 8y - 4xy - 4y^2)\, dx\, dy \\ &= \int_0^3 \left[12x - 2x^2 + 8xy - 2x^2y - 4xy^2\right]_0^{3-y} dy \\ &= \int_0^3 (18 + 6y - 10y^2 + 2y^3)\, dy \\ &= \left[18y + 3y^2 - \frac{10y^3}{3} + \frac{y^4}{2}\right]_0^3 \\ &= \frac{63}{2}.\end{aligned}$$

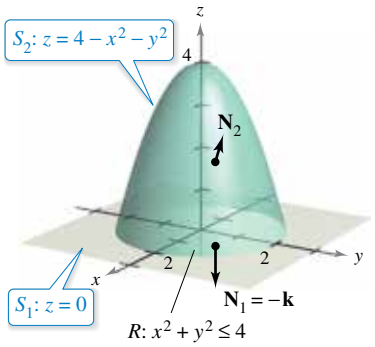

Figure 15.58

EXAMPLE 2 Verifying the Divergence Theorem

Let Q be the solid region between the paraboloid

$$z = 4 - x^2 - y^2$$

and the xy-plane. Verify the Divergence Theorem for

$$\mathbf{F}(x, y, z) = 2z\mathbf{i} + x\mathbf{j} + y^2\mathbf{k}.$$

Solution From Figure 15.58, note that the outward normal vector for the surface S_1 is $\mathbf{N}_1 = -\mathbf{k}$, whereas the outward normal vector for the surface S_2 is

$$\mathbf{N}_2 = \frac{2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k}}{\sqrt{4x^2 + 4y^2 + 1}}.$$

So, by Theorem 15.11, you have

$$\begin{aligned}
\iint_S \mathbf{F} \cdot \mathbf{N}\, dS &= \iint_{S_1} \mathbf{F} \cdot \mathbf{N}_1\, dS + \iint_{S_2} \mathbf{F} \cdot \mathbf{N}_2\, dS \\
&= \iint_{S_1} \mathbf{F} \cdot (-\mathbf{k})\, dS + \iint_{S_2} \mathbf{F} \cdot \frac{(2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k})}{\sqrt{4x^2 + 4y^2 + 1}}\, dS \\
&= \iint_R -y^2\, dA + \iint_R (4xz + 2xy + y^2)\, dA \\
&= -\int_{-2}^{2} \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} y^2\, dx\, dy + \int_{-2}^{2} \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} (4xz + 2xy + y^2)\, dx\, dy \\
&= \int_{-2}^{2} \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} (4xz + 2xy)\, dx\, dy \\
&= \int_{-2}^{2} \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} [4x(4 - x^2 - y^2) + 2xy]\, dx\, dy \\
&= \int_{-2}^{2} \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} (16x - 4x^3 - 4xy^2 + 2xy)\, dx\, dy \\
&= \int_{-2}^{2} \left[8x^2 - x^4 - 2x^2y^2 + x^2y \right]_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} dy \\
&= \int_{-2}^{2} 0\, dy \\
&= 0.
\end{aligned}$$

On the other hand, because

$$\begin{aligned}
\operatorname{div} \mathbf{F} &= \frac{\partial}{\partial x}[2z] + \frac{\partial}{\partial y}[x] + \frac{\partial}{\partial z}[y^2] \\
&= 0 + 0 + 0 \\
&= 0
\end{aligned}$$

you can apply the Divergence Theorem to obtain the equivalent result

$$\begin{aligned}
\iint_S \mathbf{F} \cdot \mathbf{N}\, dS &= \iiint_Q \operatorname{div} \mathbf{F}\, dV \\
&= \iiint_Q 0\, dV \\
&= 0.
\end{aligned}$$

EXAMPLE 3 Using the Divergence Theorem

Let Q be the solid bounded by the cylinder $x^2 + y^2 = 4$, the plane $x + z = 6$, and the xy-plane, as shown in Figure 15.59. Find

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$$

where S is the surface of Q and

$$\mathbf{F}(x, y, z) = (x^2 + \sin z)\mathbf{i} + (xy + \cos z)\mathbf{j} + e^y\mathbf{k}.$$

Solution Direct evaluation of this surface integral would be difficult. However, by the Divergence Theorem, you can evaluate the integral as follows.

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iiint_Q \operatorname{div} \mathbf{F}\, dV = \iiint_Q (2x + x + 0)\, dV = \iiint_Q 3x\, dV$$

Next, use cylindrical coordinates with $x = r\cos\theta$ and $dV = r\, dz\, dr\, d\theta$.

$$\iiint_Q 3x\, dV = \int_0^{2\pi}\int_0^2\int_0^{6 - r\cos\theta} (3r\cos\theta) r\, dz\, dr\, d\theta \qquad \text{Cylindrical coordinates}$$

$$= \int_0^{2\pi}\int_0^2 (18r^2\cos\theta - 3r^3\cos^2\theta)\, dr\, d\theta$$

$$= \int_0^{2\pi} (48\cos\theta - 12\cos^2\theta)\, d\theta$$

$$= \left[48\sin\theta - 6\left(\theta + \frac{1}{2}\sin 2\theta\right)\right]_0^{2\pi}$$

$$= -12\pi$$

Flux and the Divergence Theorem

To help understand the Divergence Theorem, consider the two sides of the equation

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iiint_Q \operatorname{div} \mathbf{F}\, dV.$$

You know from Section 15.6 that the flux integral on the left determines the total fluid flow across the surface S per unit of time. This can be approximated by summing the fluid flow across small patches of the surface. The triple integral on the right measures this same fluid flow across S but from a very different perspective—namely, by calculating the flow of fluid into (or out of) small *cubes* of volume ΔV_i. The flux of the ith cube is approximately $\operatorname{div} \mathbf{F}(x_i, y_i, z_i)\, \Delta V_i$ for some point (x_i, y_i, z_i) in the ith cube. Note that for a cube in the interior of Q, the gain (or loss) of fluid through any one of its six sides is offset by a corresponding loss (or gain) through one of the sides of an adjacent cube. After summing over all the cubes in Q, the only fluid flow that is not canceled by adjoining cubes is that on the outside edges of the cubes on the boundary. So, the sum

$$\sum_{i=1}^{n} \operatorname{div} \mathbf{F}(x_i, y_i, z_i)\, \Delta V_i$$

approximates the total flux into (or out of) Q and therefore through the surface S.

To understand what is meant by the divergence of $\mathbf{F}$ at a point, consider ΔV_α to be the volume of a small sphere S_α of radius α and center (x_0, y_0, z_0) contained in region Q, as shown in Figure 15.60.

GO DIGITAL

Applying the Divergence Theorem to S_α produces

$$\text{Flux of } \mathbf{F} \text{ across } S_\alpha = \iiint_{Q_\alpha} \operatorname{div} \mathbf{F}\, dV \approx \operatorname{div} \mathbf{F}(x_0, y_0, z_0)\, \Delta V_\alpha$$

where Q_α is the interior of S_α. Consequently,

$$\operatorname{div} \mathbf{F}(x_0, y_0, z_0) \approx \frac{\text{flux of } \mathbf{F} \text{ across } S_\alpha}{\Delta V_\alpha}.$$

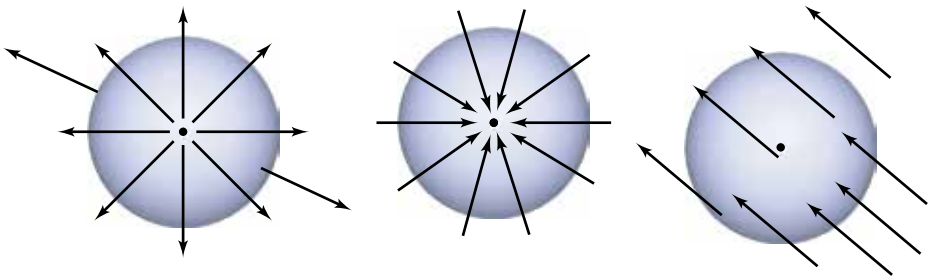
By taking the limit as $\alpha \to 0$, you obtain the divergence of $\mathbf{F}$ at the point (x_0, y_0, z_0).

$$\operatorname{div} \mathbf{F}(x_0, y_0, z_0) = \lim_{\alpha \to 0} \frac{\text{flux of } \mathbf{F} \text{ across } S_\alpha}{\Delta V_\alpha} = \text{flux per unit volume at } (x_0, y_0, z_0)$$

The point (x_0, y_0, z_0) in a vector field is classified as a source, a sink, or incompressible, as shown in the list below.

1. **Source,** for $\operatorname{div} \mathbf{F} > 0$ See Figure 15.61(a).
2. **Sink,** for $\operatorname{div} \mathbf{F} < 0$ See Figure 15.61(b).
3. **Incompressible,** for $\operatorname{div} \mathbf{F} = 0$ See Figure 15.61(c).

REMARK In hydrodynamics, a *source* is a point at which additional fluid is considered as being introduced to the region occupied by the fluid. A *sink* is a point at which fluid is considered as being removed.



(a) Source: $\operatorname{div} \mathbf{F} > 0$ **(b)** Sink: $\operatorname{div} \mathbf{F} < 0$ **(c)** Incompressible: $\operatorname{div} \mathbf{F} = 0$

Figure 15.61

EXAMPLE 4 Calculating Flux by the Divergence Theorem

See LarsonCalculus.com for an interactive version of this type of example.

Let Q be the region bounded by the sphere $x^2 + y^2 + z^2 = 4$. Find the outward flux of the vector field $\mathbf{F}(x, y, z) = 2x^3\mathbf{i} + 2y^3\mathbf{j} + 2z^3\mathbf{k}$ through the sphere.

Solution By the Divergence Theorem,

$$\text{Flux across } S = \iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iiint_Q \operatorname{div} \mathbf{F}\, dV = \iiint_Q 6(x^2 + y^2 + z^2)\, dV.$$

Next, use spherical coordinates with $\rho^2 = x^2 + y^2 + z^2$ and $dV = \rho^2 \sin\phi\, d\theta\, d\phi\, d\rho$.

$$\iiint_Q 6(x^2 + y^2 + z^2)\, dV = 6\int_0^2 \int_0^\pi \int_0^{2\pi} \rho^4 \sin\phi\, d\theta\, d\phi\, d\rho \qquad \text{Spherical coordinates}$$

$$= 6\int_0^2 \int_0^\pi 2\pi\rho^4 \sin\phi\, d\phi\, d\rho$$

$$= 12\pi \int_0^2 2\rho^4\, d\rho$$

$$= 24\pi\left(\frac{32}{5}\right)$$

$$= \frac{768\pi}{5}.$$

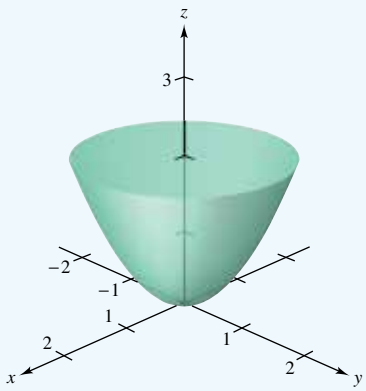
Concept Check

1. Suppose that a solid region Q is bounded by $z = x^2 + y^2$ and $z = 2$, as shown in the figure. What methods can you use to evaluate

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$$

where $\mathbf{F} = 2x\mathbf{i} + 3y\mathbf{j} - z^2\mathbf{k}$? Which method do you prefer?



2. How do you determine whether a point (x_0, y_0, z_0) in a vector field is a source, a sink, or incompressible?

Verifying the Divergence Theorem

In Exercises 3–8, verify the Divergence Theorem by evaluating

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$$

as a surface integral and as a triple integral.

3. $\mathbf{F}(x, y, z) = 2x\mathbf{i} - 2y\mathbf{j} + z^2\mathbf{k}$

S: cube bounded by the planes $x = 0$, $x = 1$, $y = 0$, $y = 1$, $z = 0$, $z = 1$

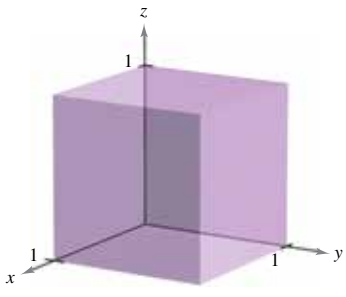


Figure for 3

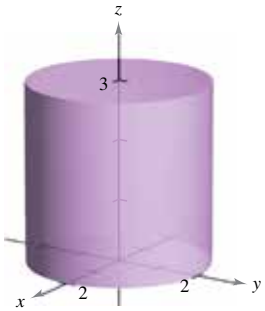

Figure for 4

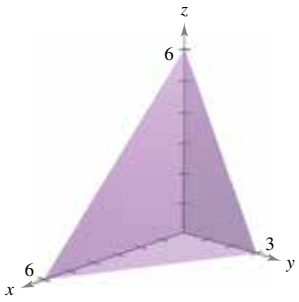
4. $\mathbf{F}(x, y, z) = 2x\mathbf{i} - 2y\mathbf{j} + z^2\mathbf{k}$

S: cylinder $x^2 + y^2 = 4$, $\quad 0 \le z \le 3$

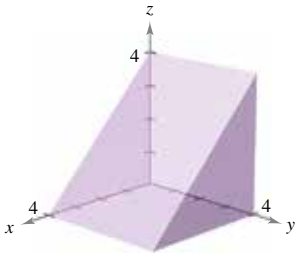
5. $\mathbf{F}(x, y, z) = (2x - y)\mathbf{i} - (2y - z)\mathbf{j} + z\mathbf{k}$

S: surface bounded by the plane $2x + 4y + 2z = 12$ and the coordinate planes



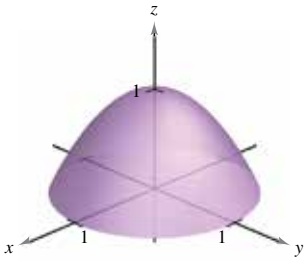
6. $\mathbf{F}(x, y, z) = xy\mathbf{i} + z\mathbf{j} + (x + y)\mathbf{k}$

S: surface bounded by the planes $y = 4$ and $z = 4 - x$ and the coordinate planes



7. $\mathbf{F}(x, y, z) = xz\mathbf{i} + zy\mathbf{j} + 2z^2\mathbf{k}$

S: surface bounded by $z = 1 - x^2 - y^2$ and $z = 0$



8. $\mathbf{F}(x, y, z) = xy^2\mathbf{i} + yx^2\mathbf{j} + e\mathbf{k}$

S: surface bounded by $z = \sqrt{x^2 + y^2}$ and $z = 4$

Using the Divergence Theorem **In Exercises 9–18, use the Divergence Theorem to evaluate**

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS$$

and find the outward flux of F through the surface of the solid S bounded by the graphs of the equations. Use a graphing utility to verify your results.

9. $\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$

S: $x = 0, x = a, y = 0, y = a, z = 0, z = a$

10. $\mathbf{F}(x, y, z) = x^2z^2\mathbf{i} - 2y\mathbf{j} + 3xyz\mathbf{k}$

S: $x = 0, x = a, y = 0, y = a, z = 0, z = a$

11. $\mathbf{F}(x, y, z) = x^2\mathbf{i} - 2xy\mathbf{j} + xyz^2\mathbf{k}$

S: $z = \sqrt{a^2 - x^2 - y^2}, z = 0$

12. $\mathbf{F}(x, y, z) = xy\mathbf{i} + yz\mathbf{j} - yz\mathbf{k}$

S: $z = \sqrt{a^2 - x^2 - y^2}, z = 0$

13. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

S: $x^2 + y^2 + z^2 = 9$

14. $\mathbf{F}(x, y, z) = xyz\mathbf{j}$

S: $x^2 + y^2 = 4, z = 0, z = 5$

15. $\mathbf{F}(x, y, z) = x\mathbf{i} + y^2\mathbf{j} - z\mathbf{k}$

S: $x^2 + y^2 = 25, z = 0, z = 7$

16. $\mathbf{F}(x, y, z) = (xy^2 + \cos z)\mathbf{i} + (x^2y + \sin z)\mathbf{j} + e^z\mathbf{k}$

S: $z = \frac{1}{2}\sqrt{x^2 + y^2}, z = 8$

17. $\mathbf{F}(x, y, z) = xe^z\mathbf{i} + ye^z\mathbf{j} + e^z\mathbf{k}$

S: $z = 4 - y, z = 0, x = 0, x = 6, y = 0$

18. $\mathbf{F}(x, y, z) = xy\mathbf{i} + 4y\mathbf{j} + xz\mathbf{k}$

S: $x^2 + y^2 + z^2 = 16$

Classifying a Point **In Exercises 19–22, a vector field and a point in the vector field are given. Determine whether the point is a source, a sink, or incompressible.**

19. $\mathbf{F}(x, y, z) = 2\mathbf{i} + y\mathbf{j} + \mathbf{k}, \quad (2, 2, 1)$

20. $\mathbf{F}(x, y, z) = e^{-x}\mathbf{i} - xy^2\mathbf{j} + \ln z\mathbf{k}, \quad (0, -3, 1)$

21. $\mathbf{F}(x, y, z) = \sin x\mathbf{i} + \cos y\mathbf{j} + z^3 \sin y\mathbf{k}, \quad \left(\frac{\pi}{2}, \pi, 4\right)$

22. $\mathbf{F}(x, y, z) = (4xy + z^2)\mathbf{i} + (2x^2 + 6yz)\mathbf{j} + 2xz\mathbf{k}, \quad (1, -4, 2)$

23. Source Find a point that is a source in the vector field

$\mathbf{F}(x, y, z) = x^2yz\mathbf{i} + x\mathbf{j} - z\mathbf{k}$.

24. Sink Find a point that is a sink in the vector field

$\mathbf{F}(x, y, z) = e^{-x}\mathbf{i} + 4y\mathbf{j} + xyz^2\mathbf{k}$.

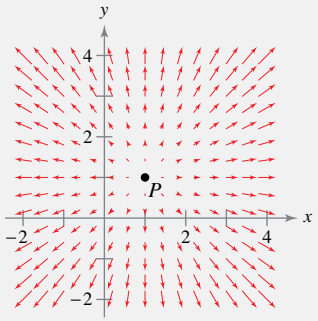
Exploring Concepts

25. What is the value of

$$\iint_S \text{curl } \mathbf{F} \cdot \mathbf{N}\, dS$$

for any closed surface S? Explain.

26. HOW DO YOU SEE IT? The graph of a vector field $\mathbf{F}$ is shown. Does the graph suggest that the divergence of $\mathbf{F}$ at P is positive, negative, or zero?



27. Volume

(a) Use the Divergence Theorem to verify that the volume of the solid bounded by a surface S is

$$\iint_S x\, dy\, dz = \iint_S y\, dz\, dx = \iint_S z\, dx\, dy.$$

(b) Verify the result of part (a) for the cube bounded by $x = 0$, $x = a$, $y = 0$, $y = a$, $z = 0$, and $z = a$.

28. Constant Vector Field For the constant vector field $\mathbf{F}(x, y, z) = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k}$, verify the following integral for any closed surface S.

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = 0$$

29. Volume For the vector field $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, verify the following integral, where V is the volume of the solid bounded by the closed surface S.

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = 3V$$

30. Verifying an Identity For the vector field $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, verify that

$$\frac{1}{\|\mathbf{F}\|}\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \frac{3}{\|\mathbf{F}\|}\iiint_Q dV.$$

Proof **In Exercises 31 and 32, prove the identity, assuming that Q, S, and $\mathbf{N}$ meet the conditions of the Divergence Theorem and that the required partial derivatives of the scalar functions f and g are continuous. The expressions $D_{\mathbf{N}}f$ and $D_{\mathbf{N}}g$ are the derivatives in the direction of the vector $\mathbf{N}$ and are defined by $D_{\mathbf{N}}f = \nabla f \cdot \mathbf{N}$ and $D_{\mathbf{N}}g = \nabla g \cdot \mathbf{N}$.**

31. $$\iiint_Q (f\nabla^2 g + \nabla f \cdot \nabla g)\, dV = \iint_S f D_{\mathbf{N}} g\, dS$$

[*Hint:* Use $\text{div}(f\mathbf{G}) = f \text{ div } \mathbf{G} + \nabla f \cdot \mathbf{G}$.]

32. $$\iiint_Q (f\nabla^2 g - g\nabla^2 f)\, dV = \iint_S (f D_{\mathbf{N}} g - g D_{\mathbf{N}} f)\, dS$$

(*Hint:* Use Exercise 31 twice.)

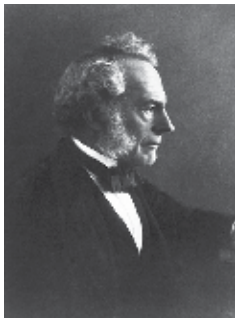
15.8 Stokes's Theorem

GO DIGITAL

- **Define and use Stokes's Theorem.**
- **Use curl to analyze the motion of a rotating liquid.**



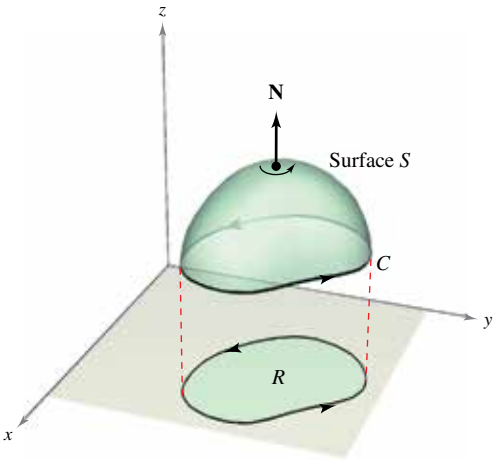
GEORGE GABRIEL STOKES (1819–1903)

Stokes became a Lucasian professor of mathematics at Cambridge in 1849. Five years later, he published the theorem that bears his name as a prize examination question there. *See LarsonCalculus.com to read more of this biography.*

Stokes's Theorem

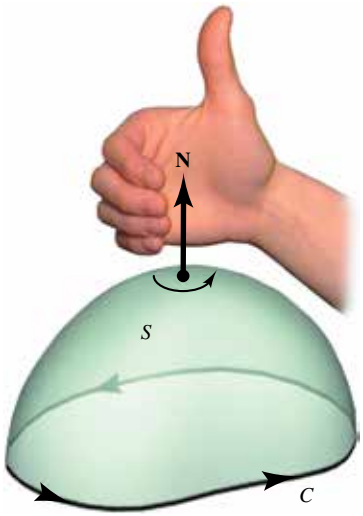
A second higher-dimension analog of Green's Theorem is called **Stokes's Theorem,** after the English mathematical physicist George Gabriel Stokes. Stokes was part of a group of English mathematical physicists referred to as the Cambridge School, which included William Thomson (Lord Kelvin) and James Clerk Maxwell. In addition to making contributions to physics, Stokes worked with infinite series and differential equations, as well as with the integration results presented in this section.

Stokes's Theorem gives the relationship between a surface integral over an oriented surface S and a line integral along a closed space curve C forming the boundary of S, as shown in Figure 15.62. The positive direction along C is counterclockwise relative to the normal vector $\mathbf{N}$. That is, when a person grasps the normal vector $\mathbf{N}$ with their right hand, with their thumb pointing in the direction of $\mathbf{N}$, their fingers will point in the positive direction C, as shown in Figure 15.63.



An oriented surface S bounded by a closed space curve C

Figure 15.62



The positive direction along C is counterclockwise relative to $\mathbf{N}$.

Figure 15.63

THEOREM 15.13 Stokes's Theorem

Let S be an oriented surface with unit normal vector $\mathbf{N}$, bounded by a piecewise smooth simple closed curve C with a positive orientation. If $\mathbf{F}$ is a vector field whose component functions have continuous first partial derivatives on an open region containing S and C, then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS.$$

In Theorem 15.13, note that the line integral may be written in the differential form $\int_C M\,dx + N\,dy + P\,dz$ or in the vector form $\int_C \mathbf{F} \cdot \mathbf{T}\,ds$.

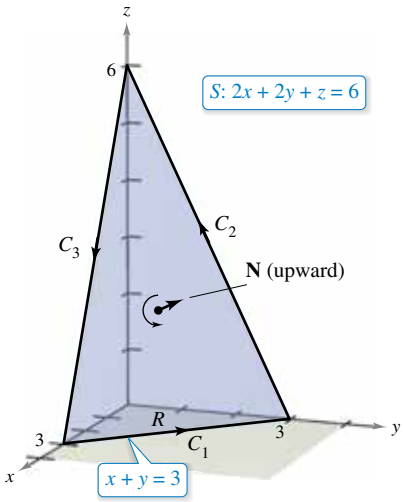

Figure 15.64

EXAMPLE 1 Using Stokes's Theorem

Let C be the oriented triangle lying in the plane

$$2x + 2y + z = 6$$

as shown in Figure 15.64. Evaluate

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

where $\mathbf{F}(x, y, z) = -y^2\mathbf{i} + z\mathbf{j} + x\mathbf{k}$.

Solution Using Stokes's Theorem, begin by finding the curl of $\mathbf{F}$.

$$\operatorname{curl} \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ -y^2 & z & x \end{vmatrix} = -\mathbf{i} - \mathbf{j} + 2y\mathbf{k}$$

Considering

$$z = g(x, y) = 6 - 2x - 2y$$

you can use Theorem 15.11 for an upward normal vector to obtain

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \iint_S (\operatorname{curl} \mathbf{F}) \cdot \mathbf{N}\, dS \\ &= \iint_R (-\mathbf{i} - \mathbf{j} + 2y\mathbf{k}) \cdot [-g_x(x, y)\mathbf{i} - g_y(x, y)\mathbf{j} + \mathbf{k}]\, dA \\ &= \iint_R (-\mathbf{i} - \mathbf{j} + 2y\mathbf{k}) \cdot (2\mathbf{i} + 2\mathbf{j} + \mathbf{k})\, dA \\ &= \int_0^3 \int_0^{3-y} (2y - 4)\, dx\, dy \\ &= \int_0^3 (-2y^2 + 10y - 12)\, dy \\ &= \left[-\frac{2y^3}{3} + 5y^2 - 12y\right]_0^3 \\ &= -9. \end{aligned}$$

Try evaluating the line integral in Example 1 directly, *without* using Stokes's Theorem. One way to do this would be to consider C as the union of C_1, C_2, and C_3, as follows.

$$\begin{aligned} C_1&: \ \mathbf{r}_1(t) = (3 - t)\mathbf{i} + t\mathbf{j}, \quad 0 \le t \le 3 \\ C_2&: \ \mathbf{r}_2(t) = (6 - t)\mathbf{j} + (2t - 6)\mathbf{k}, \quad 3 \le t \le 6 \\ C_3&: \ \mathbf{r}_3(t) = (t - 6)\mathbf{i} + (18 - 2t)\mathbf{k}, \quad 6 \le t \le 9 \end{aligned}$$

The value of the line integral is

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \int_{C_1} \mathbf{F} \cdot \mathbf{r}_1'(t)\, dt + \int_{C_2} \mathbf{F} \cdot \mathbf{r}_2'(t)\, dt + \int_{C_3} \mathbf{F} \cdot \mathbf{r}_3'(t)\, dt \\ &= \int_0^3 t^2\, dt + \int_3^6 (-2t + 6)\, dt + \int_6^9 (-2t + 12)\, dt \\ &= 9 - 9 - 9 \\ &= -9. \end{aligned}$$

EXAMPLE 2 Verifying Stokes's Theorem

See LarsonCalculus.com for an interactive version of this type of example.

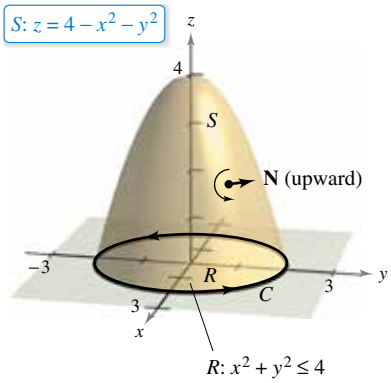

Figure 15.65

Let S be the portion of the paraboloid

$$z = 4 - x^2 - y^2$$

lying above the xy-plane, oriented upward (see Figure 15.65). Let C be its boundary curve in the xy-plane, oriented counterclockwise. Verify Stokes's Theorem for

$$\mathbf{F}(x, y, z) = 2z\mathbf{i} + x\mathbf{j} + y^2\mathbf{k}$$

by evaluating the surface integral and the equivalent line integral.

Solution As a *surface integral,* you have $z = g(x, y) = 4 - x^2 - y^2$, $g_x = -2x$, $g_y = -2y$, and

$$\operatorname{curl} \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 2z & x & y^2 \end{vmatrix} = 2y\mathbf{i} + 2\mathbf{j} + \mathbf{k}.$$

By Theorem 15.11 (for an upward normal vector), you obtain

$$\begin{aligned} \iint_S (\operatorname{curl} \mathbf{F}) \cdot \mathbf{N}\, dS &= \iint_R (2y\mathbf{i} + 2\mathbf{j} + \mathbf{k}) \cdot (2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k})\, dA \\ &= \int_{-2}^{2} \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} (4xy + 4y + 1)\, dy\, dx \\ &= \int_{-2}^{2} \left[2xy^2 + 2y^2 + y \right]_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} dx \\ &= \int_{-2}^{2} 2\sqrt{4 - x^2}\, dx \\ &= \text{Area of circle of radius 2} \\ &= 4\pi. \end{aligned}$$

As a *line integral,* you can parametrize C as

$$\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + 0\mathbf{k}, \quad 0 \le t \le 2\pi.$$

For $\mathbf{F}(x, y, z) = 2z\mathbf{i} + x\mathbf{j} + y^2\mathbf{k}$, you obtain

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \int_C M\, dx + N\, dy + P\, dz \\ &= \int_C 2z\, dx + x\, dy + y^2\, dz \\ &= \int_0^{2\pi} [0 + (2\cos t)(2\cos t) + 0]\, dt \\ &= \int_0^{2\pi} 4\cos^2 t\, dt \\ &= 2\int_0^{2\pi} (1 + \cos 2t)\, dt \\ &= 2\left[t + \frac{1}{2}\sin 2t \right]_0^{2\pi} \\ &= 4\pi. \end{aligned}$$

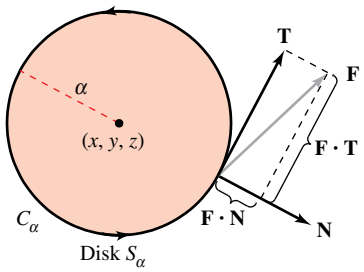

Figure 15.66

Physical Interpretation of Curl

Stokes's Theorem provides insight into a physical interpretation of curl. In a vector field $\mathbf{F}$, let S_α be a *small* circular disk of radius α, centered at (x, y, z) and with boundary C_α, as shown in Figure 15.66. At each point on the circle C_α, $\mathbf{F}$ has a normal component $\mathbf{F} \cdot \mathbf{N}$ and a tangential component $\mathbf{F} \cdot \mathbf{T}$. The more closely $\mathbf{F}$ and $\mathbf{T}$ are aligned, the greater the value of $\mathbf{F} \cdot \mathbf{T}$. So, a fluid tends to move along the circle rather than across it. Consequently, you say that the line integral around C_α measures the **circulation of F around C_α.** That is,

$$\int_{C_\alpha} \mathbf{F} \cdot \mathbf{T}\, ds = \text{circulation of } \mathbf{F} \text{ around } C_\alpha.$$

Now consider a small disk S_α to be centered at some point (x, y, z) on the surface S, as shown in Figure 15.67. On such a small disk, curl $\mathbf{F}$ is nearly constant, because it varies little from its value at (x, y, z). Moreover, $(\text{curl } \mathbf{F}) \cdot \mathbf{N}$ is also nearly constant on S_α because all unit normals to S_α are about the same. Consequently, Stokes's Theorem yields

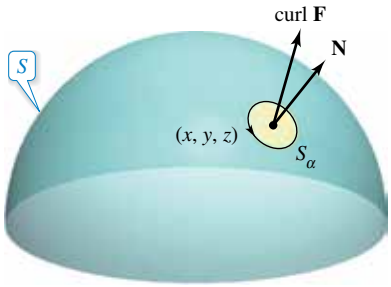

Figure 15.67

$$\begin{aligned}\int_{C_\alpha} \mathbf{F} \cdot \mathbf{T}\, ds &= \iint_{S_\alpha} (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS \\ &\approx (\text{curl } \mathbf{F}) \cdot \mathbf{N} \iint_{S_\alpha} dS \\ &\approx (\text{curl } \mathbf{F}) \cdot \mathbf{N}(\pi\alpha^2).\end{aligned}$$

So,

$$\begin{aligned}(\text{curl } \mathbf{F}) \cdot \mathbf{N} &\approx \frac{\displaystyle\int_{C_\alpha} \mathbf{F} \cdot \mathbf{T}\, ds}{\pi\alpha^2} \\ &= \frac{\text{circulation of } \mathbf{F} \text{ around } C_\alpha}{\text{area of disk } S_\alpha} \\ &= \text{rate of circulation.}\end{aligned}$$

Assuming conditions are such that the approximation improves for smaller and smaller disks $(\alpha \to 0)$, it follows that

$$(\text{curl } \mathbf{F}) \cdot \mathbf{N} = \lim_{\alpha \to 0} \frac{1}{\pi\alpha^2} \int_{C_\alpha} \mathbf{F} \cdot \mathbf{T}\, ds$$

which is referred to as the **rotation of F about N.** That is,

$$\text{curl } \mathbf{F}(x, y, z) \cdot \mathbf{N} = \text{rotation of } \mathbf{F} \text{ about } \mathbf{N} \text{ at } (x, y, z).$$

In this case, the rotation of $\mathbf{F}$ is maximum when curl $\mathbf{F}$ and $\mathbf{N}$ have the same direction. Normally, this tendency to rotate will vary from point to point on the surface S, and Stokes's Theorem

$$\underbrace{\iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS}_{\text{Surface integral}} = \underbrace{\int_C \mathbf{F} \cdot d\mathbf{r}}_{\text{Line integral}}$$

says that the collective measure of this *rotational* tendency taken over the entire surface S (surface integral) is equal to the tendency of a fluid to *circulate* around the boundary C (line integral).

EXAMPLE 3 An Application of Curl

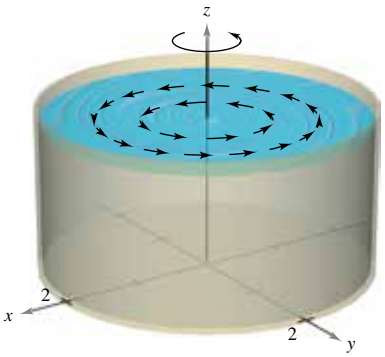
A liquid is swirling around in a cylindrical container of radius 2, so that its motion is described by the velocity field

$$\mathbf{F}(x, y, z) = -y\sqrt{x^2 + y^2}\,\mathbf{i} + x\sqrt{x^2 + y^2}\,\mathbf{j}$$

as shown in the figure. Find

$$\iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS$$

where S is the upper surface of the cylindrical container.



Solution The curl of $\mathbf{F}$ is given by

$$\text{curl } \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ -y\sqrt{x^2 + y^2} & x\sqrt{x^2 + y^2} & 0 \end{vmatrix} = 3\sqrt{x^2 + y^2}\,\mathbf{k}.$$

Letting $\mathbf{N} = \mathbf{k}$, you have

$$\begin{aligned} \iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS &= \iint_R 3\sqrt{x^2 + y^2}\, dA \\ &= \int_0^{2\pi} \int_0^2 (3r) r\, dr\, d\theta \\ &= \int_0^{2\pi} r^3 \Big]_0^2 d\theta \\ &= \int_0^{2\pi} 8\, d\theta \\ &= 16\pi. \end{aligned}$$

If curl $\mathbf{F} = \mathbf{0}$ throughout region Q, then the rotation of $\mathbf{F}$ about each unit normal $\mathbf{N}$ is 0. That is, $\mathbf{F}$ is irrotational. From Section 15.1, you know that this is a characteristic of conservative vector fields.

Summary of Integration Formulas

Fundamental Theorem of Calculus

$$\int_a^b F'(x)\, dx = F(b) - F(a)$$

Fundamental Theorem of Line Integrals

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = f(x(b), y(b)) - f(x(a), y(a))$$

Green's Theorem

$$\int_C M\, dx + N\, dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dA = \int_C \mathbf{F} \cdot \mathbf{T}\, ds = \int_C \mathbf{F} \cdot d\mathbf{r} = \iint_R (\text{curl } \mathbf{F}) \cdot \mathbf{k}\, dA$$

$$\int_C \mathbf{F} \cdot \mathbf{N}\, ds = \iint_R \text{div } \mathbf{F}\, dA$$

Divergence Theorem

$$\iint_S \mathbf{F} \cdot \mathbf{N}\, dS = \iiint_Q \text{div } \mathbf{F}\, dV$$

Stokes's Theorem

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \iint_S (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS$$

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain the benefit of Stokes's Theorem when the boundary of the surface is a piecewise curve.
2. What is a physical interpretation of curl?

Verifying Stokes's Theorem **In Exercises 3–6, verify Stokes's Theorem by evaluating $\int_C \mathbf{F} \cdot d\mathbf{r}$ as a line integral and as a double integral.**

3. $\mathbf{F}(x, y, z) = (-y + z)\mathbf{i} + (x - z)\mathbf{j} + (x - y)\mathbf{k}$
   S: $z = 9 - x^2 - y^2, \quad z \geq 0$
4. $\mathbf{F}(x, y, z) = (-y + z)\mathbf{i} + (x - z)\mathbf{j} + (x - y)\mathbf{k}$
   S: $z = \sqrt{1 - x^2 - y^2}$
5. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
   S: $6x + 6y + z = 12$, first octant
6. $\mathbf{F}(x, y, z) = z^2\mathbf{i} + x^2\mathbf{j} + y^2\mathbf{k}$
   S: $z = y^2, \quad 0 \leq x \leq a, \quad 0 \leq y \leq a$

Using Stokes's Theorem **In Exercises 7–16, use Stokes's Theorem to evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$. In each case, C is oriented counterclockwise as viewed from above.**

7. $\mathbf{F}(x, y, z) = 2y\mathbf{i} + 3z\mathbf{j} + x\mathbf{k}$
   C: triangle with vertices $(2, 0, 0)$, $(0, 2, 0)$, and $(0, 0, 2)$
8. $\mathbf{F}(x, y, z) = 4z\mathbf{i} + x^2\mathbf{j} + e^y\mathbf{k}$
   C: triangle with vertices $(4, 0, 0)$, $(0, 2, 0)$, and $(0, 0, 8)$
9. $\mathbf{F}(x, y, z) = z^2\mathbf{i} + 2x\mathbf{j} + y^2\mathbf{k}$
   S: $z = 1 - x^2 - y^2, \quad z \geq 0$
10. $\mathbf{F}(x, y, z) = 4xz\mathbf{i} + y\mathbf{j} + 4xy\mathbf{k}$
    S: $z = 9 - x^2 - y^2, \quad z \geq 0$
11. $\mathbf{F}(x, y, z) = z^2\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
    S: $z = \sqrt{4 - x^2 - y^2}$
12. $\mathbf{F}(x, y, z) = x^2\mathbf{i} + z^2\mathbf{j} - xyz\mathbf{k}$
    S: $z = \sqrt{4 - x^2 - y^2}$
13. $\mathbf{F}(x, y, z) = -\ln\sqrt{x^2 + y^2}\,\mathbf{i} + \arctan\frac{x}{y}\mathbf{j} + \mathbf{k}$
    S: $z = 9 - 2x - 3y$ over $r = 2\sin 2\theta$ in the first octant
14. $\mathbf{F}(x, y, z) = yz\mathbf{i} + (2 - 3y)\mathbf{j} + (x^2 + y^2)\mathbf{k}, \quad x^2 + y^2 \leq 16$
    S: the first-octant portion of $x^2 + z^2 = 16$ over $x^2 + y^2 = 16$
15. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
    S: $z = x^2, \quad 0 \leq x \leq a, \quad 0 \leq y \leq a$
16. $\mathbf{F}(x, y, z) = xyz\mathbf{i} + y\mathbf{j} + z\mathbf{k}, \quad x^2 + y^2 \leq a^2$
    S: the first-octant portion of $z = x^2$ over $x^2 + y^2 = a^2$

Motion of a Liquid **In Exercises 17 and 18, the motion of a liquid in a cylindrical container of radius 3 is described by the velocity field $\mathbf{F}(x, y, z)$. Find $\int_S \int (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS$, where S is the upper surface of the cylindrical container.**

17. $\mathbf{F}(x, y, z) = -\frac{1}{6}y^3\mathbf{i} + \frac{1}{6}x^3\mathbf{j} + 5\mathbf{k}$
18. $\mathbf{F}(x, y, z) = -z\mathbf{i} + y^2\mathbf{k}$

Exploring Concepts

19. Let $\mathbf{K}$ be a constant vector. Let S be an oriented surface with a unit normal vector $\mathbf{N}$, bounded by a smooth curve C. Determine whether

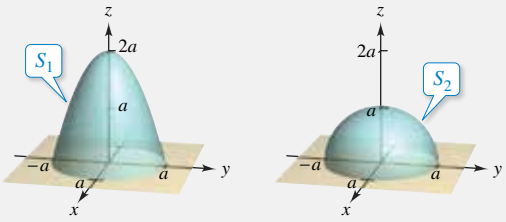
$$\int_S \int \mathbf{K} \cdot \mathbf{N}\, dS = \frac{1}{2}\int_C (\mathbf{K} \times \mathbf{r}) \cdot d\mathbf{r}.$$

Explain. (*Hint:* Use $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$.)

20. **HOW DO YOU SEE IT?** Let S_1 be the portion of the paraboloid lying above the xy-plane, and let S_2 be the hemisphere, as shown in the figures. Both surfaces are oriented upward. For a vector field $\mathbf{F}(x, y, z)$ with continuous partial derivatives, does

$$\int_{S_1} \int (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS_1 = \int_{S_2} \int (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS_2?$$

Explain your reasoning.



PUTNAM EXAM CHALLENGE

21. Let $\mathbf{G}(x, y) = \left(\frac{-y}{x^2 + 4y^2}, \frac{x}{x^2 + 4y^2}, 0\right)$.

Prove or disprove that there is a vector-valued function $\mathbf{F}(x, y, z) = (M(x, y, z), N(x, y, z), P(x, y, z))$ with the following properties:

(i) M, N, P have continuous partial derivatives for all $(x, y, z) \neq (0, 0, 0)$;

(ii) Curl $\mathbf{F} = \mathbf{0}$ for all $(x, y, z) \neq (0, 0, 0)$;

(iii) $\mathbf{F}(x, y, 0) = \mathbf{G}(x, y)$.

This problem was composed by the Committee on the Putnam Prize Competition.

Exploring Concepts

In this chapter, you developed the calculus of vector fields. The most important examples of vector fields are velocity fields, gravitational fields, and electric force fields. You also developed several important theorems that are fundamental to understanding calculus. These theorems, which build upon the Fundamental Theorem of Calculus, have an essential similarity. The cumulative (or integrated) effect of the derivatives of a function throughout a region is equal to the values of the function on the boundary of the region. For instance, consider the Fundamental Theorem of Calculus and the Fundamental Theorem of Line Integrals.

Fundamental Theorem of Calculus

$$\int_a^b f(x)\,dx = F(b) - F(a)$$

Fundamental Theorem of Line Integrals

$$\int_C \nabla f \cdot d\mathbf{r} = f(x(b), y(b)) - f(x(a), y(a))$$

This relationship also exists in other fundamental theorems of calculus, such as Green's Theorem, the Divergence Theorem, and Stokes's Theorem.

1. (a) Describe a conservative vector field.

(b) Describe a potential function.

2. Let $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ and let S be the cube bounded by the planes $x = 0, x = 1, y = 0, y = 1, z = 0$, and $z = 1$. Verify the Divergence Theorem by evaluating

$$\iint_S \mathbf{F} \cdot \mathbf{N}\,dS$$

as a surface integral and as a triple integral.

3. Let $\mathbf{F}(x, y, z) = z^2\mathbf{i} + x^2\mathbf{j} + y^2\mathbf{k}$ and let S be the upward oriented surface given by the portion of the paraboloid $z = x^2 + y^2$ that lies below the plane $z = 4$. Verify Stokes's Theorem for $\mathbf{F}$. Is the line integral or the double integral easier to set up? to evaluate? Explain.

4. Define a line integral of a function f along a smooth curve C in the plane and in space. How do you evaluate the line integral as a definite integral?

5. Define a line integral of a continuous vector field $\mathbf{F}$ on a smooth curve C. How do you evaluate the line integral as a definite integral?

6. Consider the vector field $\mathbf{F}(x, y, z) = z\mathbf{i} + x\mathbf{j} + y\mathbf{k}$ and the orientable surface given in parametric form by

$\mathbf{r}(u, v) = (u + v^2)\mathbf{i} + (u - v)\mathbf{j} + u^2\mathbf{k}$

where $0 \le u \le 2$ and $-1 \le v \le 1$.

(a) Find and interpret $\mathbf{r}_u \times \mathbf{r}_v$.

(b) Find $\mathbf{F} \cdot (\mathbf{r}_u \times \mathbf{r}_v)$ as a function of u and v.

(c) Find u and v at the point $P(3, 1, 4)$.

(d) Explain how to find the normal component of $\mathbf{F}$ to the surface at P. Then find this value.

(e) Evaluate the flux integral

$$\iint_S \mathbf{F} \cdot \mathbf{N}\,dS.$$

Sketching a Vector Field

In Exercises 7 and 8, find $\|\mathbf{F}\|$ and sketch several representative vectors in the vector field. Use a graphing utility to verify your results.

7. $\mathbf{F}(x, y, z) = x\mathbf{i} + \mathbf{j} + 2\mathbf{k}$

8. $\mathbf{F}(x, y) = \mathbf{i} - 2y\mathbf{j}$

Finding a Conservative Vector Field

In Exercises 9–12, find the conservative vector field for the potential function by finding its gradient.

9. $f(x, y) = \sin xy - y^2$

10. $f(x, y) = \sqrt{xy}$

11. $f(x, y, z) = 2x^2 + xy + z^2$

12. $f(x, y, z) = x^2e^{yz}$

Testing for a Conservative Vector Field

In Exercises 13–16, determine whether the vector field is conservative.

13. $\mathbf{F}(x, y) = \cosh y\mathbf{i} + x \sinh x\mathbf{j}$

14. $\mathbf{F}(x, y) = \dfrac{y \ln x}{x}\mathbf{i} + (\ln x)^2\mathbf{j}$

15. $\mathbf{F}(x, y, z) = y^2\mathbf{i} + 2xy\mathbf{j} + \cos z\mathbf{k}$

16. $\mathbf{F}(x, y, z) = 3e^{xy}\mathbf{i} + 3e^{x+y}\mathbf{j} + e^{3yz}\mathbf{k}$

Finding a Potential Function

In Exercises 17–24, determine whether the vector field is conservative. If it is, find a potential function for the vector field.

17. $\mathbf{F}(x, y) = -\dfrac{y}{x^2}\mathbf{i} + \dfrac{1}{x}\mathbf{j}$

18. $\mathbf{F}(x, y) = \dfrac{1}{y}\mathbf{i} - \dfrac{y}{x^2}\mathbf{j}$

19. $\mathbf{F}(x, y) = (xy^2 - x^2)\mathbf{i} + (x^2y + y^2)\mathbf{j}$

20. $\mathbf{F}(x, y) = (-2y^3 \sin 2x)\mathbf{i} + 3y^2(1 + \cos 2x)\mathbf{j}$

21. $\mathbf{F}(x, y, z) = 4xy^2\mathbf{i} + 2x^2\mathbf{j} + 2z\mathbf{k}$

22. $\mathbf{F}(x, y, z) = (4xy + z^2)\mathbf{i} + (2x^2 + 6yz)\mathbf{j} + 2xz\mathbf{k}$

23. $\mathbf{F}(x, y, z) = \dfrac{yz\mathbf{i} - xz\mathbf{j} - xy\mathbf{k}}{y^2z^2}$

24. $\mathbf{F}(x, y, z) = (\sin z)(y\mathbf{i} + x\mathbf{j} + \mathbf{k})$

Divergence and Curl **In Exercises 25–32, find (a) the divergence of the vector field and (b) the curl of the vector field.**

25. $\mathbf{F}(x, y, z) = x^2\mathbf{i} + xy^2\mathbf{j} + x^2z\mathbf{k}$

26. $\mathbf{F}(x, y, z) = y^2\mathbf{j} - z^2\mathbf{k}$

27. $\mathbf{F}(x, y, z) = (\cos y + y\cos x)\mathbf{i} + (\sin x - x\sin y)\mathbf{j} + xyz\mathbf{k}$

28. $\mathbf{F}(x, y, z) = (3x - y)\mathbf{i} + (y - 2z)\mathbf{j} + (z - 3x)\mathbf{k}$

29. $\mathbf{F}(x, y, z) = \arcsin x\mathbf{i} + xy^2\mathbf{j} + yz^2\mathbf{k}$

30. $\mathbf{F}(x, y, z) = (x^2 - y)\mathbf{i} - (x + \sin^2 y)\mathbf{j}$

31. $\mathbf{F}(x, y, z) = \ln(x^2 + y^2)\mathbf{i} + \ln(x^2 + y^2)\mathbf{j} + z\mathbf{k}$

32. $\mathbf{F}(x, y, z) = \dfrac{z}{x}\mathbf{i} + \dfrac{z}{y}\mathbf{j} + z^2\mathbf{k}$

Evaluating a Line Integral **In Exercises 33–36, evaluate the line integral along the given path(s).**

33. $\displaystyle\int_C (x^2 + y^2)\,ds$

(a) C: line segment from $(0, 0)$ to $(3, 4)$

(b) C: one revolution counterclockwise around the circle $x^2 + y^2 = 1$, starting at $(1, 0)$

34. $\displaystyle\int_C xy\,ds$

(a) C: line segment from $(0, 0)$ to $(5, 4)$

(b) C: counterclockwise around the triangle with vertices $(0, 0)$, $(4, 0)$, and $(0, 2)$

35. $\displaystyle\int_C (x^2 + y^2)\,ds$

C: $\mathbf{r}(t) = (1 - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j}, \quad 0 \le t \le 2\pi$

36. $\displaystyle\int_C (x^2 + y^2)\,ds$

C: $\mathbf{r}(t) = (\cos t + t\sin t)\mathbf{i} + (\sin t - t\cos t)\mathbf{j}, \quad 0 \le t \le 2\pi$

Evaluating a Line Integral Using Technology **In Exercises 37 and 38, use a graphing utility to evaluate the line integral along the given path.**

37. $\displaystyle\int_C (2x + y)\,ds$

C: $\mathbf{r}(t) = a\cos^3 t\mathbf{i} + a\sin^3 t\mathbf{j}, \quad 0 \le t \le \dfrac{\pi}{2}$

38. $\displaystyle\int_C (x^2 + y^2 + z^2)\,ds$

C: $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^{3/2}\mathbf{k}, \quad 0 \le t \le 4$

Mass **In Exercises 39 and 40, find the total mass of the wire with density ρ whose shape is modeled by r.**

39. $\mathbf{r}(t) = 3\cos t\mathbf{i} + 3\sin t\mathbf{j}, \quad 0 \le t \le \pi, \quad \rho(x, y) = 1 + x$

40. $\mathbf{r}(t) = 3\mathbf{i} + t^2\mathbf{j} + 2t\mathbf{k}, \quad 2 \le t \le 4, \quad \rho(x, y, z) = xz$

Evaluating a Line Integral of a Vector Field **In Exercises 41–44, evaluate $\displaystyle\int_C \mathbf{F} \cdot d\mathbf{r}$.**

41. $\mathbf{F}(x, y) = xy\mathbf{i} + 2xy\mathbf{j}$

C: $\mathbf{r}(t) = t^2\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 1$

42. $\mathbf{F}(x, y) = (x - y)\mathbf{i} + (x + y)\mathbf{j}$

C: $\mathbf{r}(t) = 4\cos t\mathbf{i} + 3\sin t\mathbf{j}, \quad 0 \le t \le 2\pi$

43. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

C: $\mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 2\pi$

44. $\mathbf{F}(x, y, z) = (2y - z)\mathbf{i} + (z - x)\mathbf{j} + (x - y)\mathbf{k}$

C: $\mathbf{r}(t) = -3t\mathbf{i} + (2t + 1)\mathbf{j} + 4\mathbf{k}, \quad 0 \le t \le 2$

Work **In Exercises 45 and 46, find the work done by the force field F on a particle moving along the given path.**

45. $\mathbf{F}(x, y) = x\mathbf{i} - \sqrt{y}\mathbf{j}$

C: $x = t$, $y = t^{3/2}$ from $(0, 0)$ to $(4, 8)$

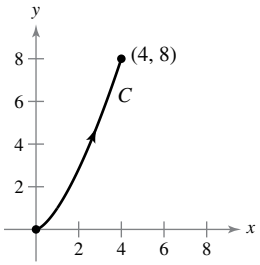

Figure for 45

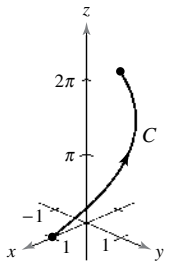

Figure for 46

46. $\mathbf{F}(x, y, z) = 2\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

C: $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + 2t\mathbf{k}, \quad 0 \le t \le \pi$

Evaluating a Line Integral in Differential Form **In Exercises 47 and 48, evaluate $\displaystyle\int_C (y - x)\,dx + (2x + 5y)\,dy$.**

47. C: line segments from $(0, 0)$ to $(2, -4)$ and $(2, -4)$ to $(4, -4)$

48. C: arc on $y = \sqrt{x}$ from $(0, 0)$ to $(9, 3)$

Lateral Surface Area **In Exercises 49 and 50, find the area of the lateral surface over the curve C in the xy-plane and under the surface $z = f(x, y)$, where**

Lateral surface area $= \displaystyle\int_C f(x, y)\,ds$.

49. $f(x, y) = 3 + \sin(x + y)$; C: $y = 2x$ from $(0, 0)$ to $(2, 4)$

50. $f(x, y) = 12 - x - y$; C: $y = x^2$ from $(0, 0)$ to $(2, 4)$

Line Integral of a Conservative Vector Field **In Exercises 51 and 52, (a) show that F is conservative and (b) verify that the value of $\displaystyle\int_C \mathbf{F} \cdot d\mathbf{r}$ is the same for each parametric representation of C.**

51. $\mathbf{F}(x, y) = (3x + 4)\mathbf{i} + y^3\mathbf{j}$

(i) $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}, \; 0 \le t \le 4$

(ii) $\mathbf{r}(w) = w^2\mathbf{i} + w^2\mathbf{j}, \; 0 \le w \le 2$

52. $\mathbf{F}(x, y) = xy\mathbf{i} + \frac{1}{2}x^2\mathbf{j}$

(i) $\mathbf{r}(\theta) = \sin\theta\mathbf{i} + \cos\theta\mathbf{j}, 0 \le \theta \le \dfrac{\pi}{2}$

(ii) $\mathbf{r}(t) = t\mathbf{i} + (1 - t)\mathbf{j}, 0 \le t \le 1$

Using the Fundamental Theorem of Line Integrals **In Exercises 53–56, evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$ using the Fundamental Theorem of Line Integrals.**

53. $\mathbf{F}(x, y) = e^{2x}\mathbf{i} + e^{2y}\mathbf{j}$

C: line segment from $(-1, -1)$ to $(0, 0)$

54. $\mathbf{F}(x, y) = -\sin y\mathbf{i} - x\cos y\mathbf{j}$

C: clockwise around the circle $(x + 1)^2 + y^2 = 16$ from $(-1, 4)$ to $(3, 0)$

55. $\mathbf{F}(x, y, z) = 2xyz\mathbf{i} + x^2z\mathbf{j} + x^2y\mathbf{k}$

C: smooth curve from $(0, 0, 0)$ to $(1, 3, 2)$

56. $\mathbf{F}(x, y, z) = y\mathbf{i} + x\mathbf{j} + \dfrac{1}{z}\mathbf{k}$

C: smooth curve from $(0, 0, 1)$ to $(4, 4, 4)$

Finding Work in a Conservative Force Field **In Exercises 57 and 58, (a) show that $\int_C \mathbf{F} \cdot d\mathbf{r}$ is independent of path and (b) calculate the work done by the force field F on an object moving along a curve from P to Q.**

57. $\mathbf{F}(x, y) = (1 - 3xy^2)\mathbf{i} - 3x^2y\mathbf{j}$; $P(4, 2), Q(0, 1)$

58. $\mathbf{F}(x, y) = e^{2y}\mathbf{i} + 2xe^{2y}\mathbf{j}$; $P(-1, 3), Q(4, 5)$

Evaluating a Line Integral Using Green's Theorem **In Exercises 59–64, use Green's Theorem to evaluate the line integral.**

59. $\displaystyle\int_C y\,dx + 2x\,dy$

C: square with vertices $(0, 0)$, $(0, 1)$, $(1, 0)$, and $(1, 1)$

60. $\displaystyle\int_C xy\,dx + (x^2 + y^2)\,dy$

C: square with vertices $(0, 0)$, $(0, 2)$, $(2, 0)$, and $(2, 2)$

61. $\displaystyle\int_C xy^2\,dx + x^2y\,dy$

C: $x = 4\cos t, y = 4\sin t$

62. $\displaystyle\int_C (x^2 - y^2)\,dx + 3y^2\,dy$

C: $x^2 + y^2 = 9$

63. $\displaystyle\int_C xy\,dx + x^2\,dy$

C: boundary of the region between the graphs of $y = x^2$ and $y = 1$

64. $\displaystyle\int_C y^2\,dx + x^{4/3}\,dy$

C: $x^{2/3} + y^{2/3} = 1$

Work **In Exercises 65 and 66, use Green's Theorem to calculate the work done by the force F on a particle that is moving counterclockwise around the closed path C.**

65. $\mathbf{F}(x, y) = y^2\mathbf{i} + 2xy\mathbf{j}$

C: $x^2 + y^2 = 36$

66. $\mathbf{F}(x, y) = 3\mathbf{i} + (x^3 + 1)\mathbf{j}$

C: boundary of the region lying between the graphs of $y = x^2$ and $y = 4$

Area **In Exercises 67 and 68, use a line integral to find the area of the region R.**

67. R: triangle bounded by the graphs of $y = \frac{1}{2}x$, $y = 6 - x$, and $y = x$

68. R: region bounded by the graphs of $y = 3x$ and $y = 4 - x^2$

Sketching a Parametric Surface **In Exercises 69 and 70, find the rectangular equation for the surface by eliminating the parameters from the vector-valued function. Identify the surface and sketch its graph.**

69. $\mathbf{r}(u, v) = 3u\cos v\mathbf{i} + 3u\sin v\mathbf{j} + 18u^2\mathbf{k}$

70. $\mathbf{r}(u, v) = 3(u + v)\mathbf{i} + u\mathbf{j} - 6v\mathbf{k}$

Graphing a Parametric Surface **In Exercises 71 and 72, use a graphing utility to graph the surface represented by the vector-valued function.**

71. $\mathbf{r}(u, v) = \sec u\cos v\mathbf{i} + (1 + 2\tan u)\sin v\mathbf{j} + 2u\mathbf{k}$

$0 \le u \le \dfrac{\pi}{3}, \quad 0 \le v \le 2\pi$

72. $\mathbf{r}(u, v) = e^{-u/4}\cos v\mathbf{i} + e^{-u/4}\sin v\mathbf{j} + \dfrac{u}{6}\mathbf{k}$

$0 \le u \le 4, \quad 0 \le v \le 2\pi$

Representing a Surface Parametrically **In Exercises 73 and 74, find a vector-valued function whose graph is the indicated surface.**

73. The ellipsoid $\dfrac{x^2}{1} + \dfrac{y^2}{8} + \dfrac{z^2}{9} = 1$

74. The part of the plane $z = 2$ that lies inside the cylinder $x^2 + y^2 = 25$

Representing a Surface of Revolution Parametrically **In Exercises 75 and 76, write a set of parametric equations for the surface of revolution obtained by revolving the graph of the function about the given axis.**

Function	Axis of Revolution
75. $y = 2x^3, 0 \le x \le 2$	x-axis
76. $z = \sqrt{y + 1}, 0 \le y \le 3$	y-axis

Finding Surface Area **In Exercises 77 and 78, find the area of the surface over the given region. Use a graphing utility to verify your results.**

77. $\mathbf{r}(u, v) = 4u\mathbf{i} + (3u - v)\mathbf{j} + v\mathbf{k}$

$0 \le u \le 3, \quad 0 \le v \le 1$

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

78. $\mathbf{r}(u, v) = 3u \cos v\mathbf{i} + 3u \sin v\mathbf{j} + u\mathbf{k}$

$0 \le u \le 2, \quad 0 \le v \le 2\pi$

Evaluating a Surface Integral **In Exercises 79 and 80, evaluate $\int_S\int (5x + y - 2z)\, dS$.**

79. S: $z = x + \frac{y}{2}, \quad 0 \le x \le 2, \quad 0 \le y \le 5$

80. S: $z = e^2 - x, \quad 0 \le x \le 4, \quad 0 \le y \le \sqrt{x}$

Mass **In Exercises 81 and 82, find the mass of the surface lamina S of density ρ.**

81. S: $2y + 6x + z = 18$, first octant, $\rho(x, y, z) = 2x$

82. S: $z = 20 - 4x - 5y$, first octant, $\rho(x, y, z) = ky$

Evaluating a Surface Integral **In Exercises 83 and 84, evaluate $\int_S\int f(x, y)\, dS$.**

83. $f(x, y) = x + y$

S: $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + 5v\mathbf{k}, \quad 0 \le u \le 1, \quad 0 \le v \le 3$

84. $f(x, y) = x^2y$

S: $\mathbf{r}(u, v) = 5 \cos u\mathbf{i} + 5 \sin u\mathbf{j} + v\mathbf{k}$

$0 \le u \le \frac{\pi}{2}, \quad 0 \le v \le 1$

Evaluating a Flux Integral **In Exercises 85 and 86, find the flux of F across S,**

$$\int_S\int \mathbf{F} \cdot \mathbf{N}\, dS$$

where N is the upward unit normal vector to S.

85. $\mathbf{F}(x, y, z) = -2\mathbf{i} - 2\mathbf{j} + \mathbf{k}$

S: $z = 25 - x^2 - y^2, \quad z \ge 0$

86. $\mathbf{F}(x, y, z) = x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$

S: $x + y + 3z = 3$, first octant

Using the Divergence Theorem **In Exercises 87 and 88, use the Divergence Theorem to evaluate**

$$\int_S\int \mathbf{F} \cdot \mathbf{N}\, dS$$

and find the outward flux of F through the surface of the solid bounded by the graphs of the equations.

87. $\mathbf{F}(x, y, z) = x^2\mathbf{i} + xy\mathbf{j} + z\mathbf{k}$

Q: solid region bounded by the coordinate planes and the plane $2x + 3y + 4z = 12$

88. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

Q: solid region bounded by the coordinate planes and the plane $2x + 3y + 4z = 12$

Using Stokes's Theorem **In Exercises 89 and 90, use Stokes's Theorem to evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$. In each case, C is oriented counterclockwise as viewed from above.**

89. $\mathbf{F}(x, y, z) = (\cos y + y \cos x)\mathbf{i} + (\sin x - x \sin y)\mathbf{j} + xyz\mathbf{k}$

S: portion of $z = y^2$ over the square in the xy-plane with vertices $(0, 0)$, $(a, 0)$, (a, a), and $(0, a)$

90. $\mathbf{F}(x, y, z) = (x - z)\mathbf{i} + (y - z)\mathbf{j} + x^2\mathbf{k}$

S: first-octant portion of the plane $3x + y + 2z = 12$

Motion of a Liquid **In Exercises 91 and 92, the motion of a liquid in a cylindrical container of radius 4 is described by the velocity field $\mathbf{F}(x, y, z)$. Find $\int_S\int (\text{curl } \mathbf{F}) \cdot \mathbf{N}\, dS$, where S is the upper surface of the cylindrical container.**

91. $\mathbf{F}(x, y, z) = \mathbf{i} + x\mathbf{j} - \mathbf{k}$

92. $\mathbf{F}(x, y, z) = y^2\mathbf{i} + 3z\mathbf{j} + \mathbf{k}$

Building on Concepts

93. Let $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ and let $f(x, y, z) = \|\mathbf{F}(x, y, z)\|$.

(a) Show that $\nabla(\ln f) = \frac{\mathbf{F}}{f^2}$.

(b) Show that $\nabla\left(\frac{1}{f}\right) = -\frac{\mathbf{F}}{f^3}$.

(c) Show that $\nabla f^n = nf^{n-2}\mathbf{F}$.

(d) The **Laplacian** is the differential operator

$$\nabla^2 = \nabla \cdot \nabla = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}$$

and **Laplace's equation** is

$$\nabla^2 w = \frac{\partial^2 w}{\partial x^2} + \frac{\partial^2 w}{\partial y^2} + \frac{\partial^2 w}{\partial z^2} = 0.$$

Any function that satisfies this equation is called **harmonic.** Show that the function $w = 1/f$ is harmonic.

94. The figure shows the force field

$\mathbf{F}(x, y) = 3x^2y^2\mathbf{i} + 2x^3y\mathbf{j}$.

Three particles move from the point $(1, 1)$ to the point $(2, 4)$ along different paths. Explain why the work done is the same for each particle, and find the value of the work.

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

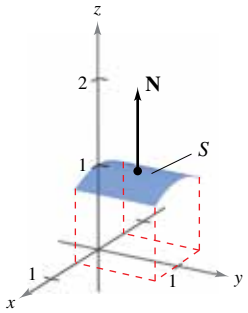
1. Heat Flux Consider a single heat source located at the origin with temperature

$$T(x, y, z) = \frac{25}{\sqrt{x^2 + y^2 + z^2}}.$$

(a) Calculate the heat flux across the surface

$$S = \left\{(x, y, z): z = \sqrt{1 - x^2}, -\frac{1}{2} \le x \le \frac{1}{2}, 0 \le y \le 1\right\}$$

as shown in the figure.



(b) Repeat the calculation in part (a) using the parametrization

$$x = \cos u, \quad y = v, \quad z = \sin u$$

where

$$\frac{\pi}{3} \le u \le \frac{2\pi}{3} \quad \text{and} \quad 0 \le v \le 1.$$

2. Green's Theorem Consider the line integral

$$\int_C y^n\,dx + x^n\,dy$$

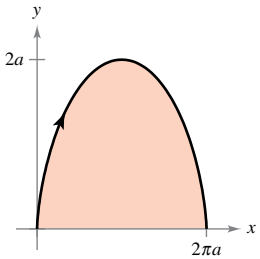
where C is the boundary of the region lying between the graphs of $y = \sqrt{a^2 - x^2}$, $a > 0$, and $y = 0$.

(a) Use a graphing utility to verify Green's Theorem for n, an odd integer from 1 through 7.

(b) Use a graphing utility to verify Green's Theorem for n, an even integer from 2 through 8.

(c) For n an odd integer, make a conjecture about the value of the integral.

3. Area Use a line integral to find the area bounded by one arch of the cycloid $x(\theta) = a(\theta - \sin\theta)$, $y(\theta) = a(1 - \cos\theta)$, $0 \le \theta \le 2\pi$, as shown in the figure.



4. Verifying Identities

(a) Let f and g be scalar functions with continuous partial derivatives, and let C and S satisfy the conditions of Stokes's Theorem. Verify each identity.

(i) $\displaystyle\int_C (f\nabla g)\cdot d\mathbf{r} = \iint_S (\nabla f \times \nabla g)\cdot \mathbf{N}\,dS$

(ii) $\displaystyle\int_C (f\nabla f)\cdot d\mathbf{r} = 0$

(iii) $\displaystyle\int_C (f\nabla g + g\nabla f)\cdot d\mathbf{r} = 0$

(b) Demonstrate the results of part (a) for the functions

$$f(x, y, z) = xyz \quad \text{and} \quad g(x, y, z) = z.$$

Let S be the hemisphere

$$z = \sqrt{4 - x^2 - y^2}.$$

5. Moments of Inertia Consider a wire of density $\rho(x, y, z)$ given by the space curve

$$C: \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}, \quad a \le t \le b.$$

The **moments of inertia** about the x-, y-, and z-axes are given by

$$I_x = \int_C (y^2 + z^2)\rho(x, y, z)\,ds$$

$$I_y = \int_C (x^2 + z^2)\rho(x, y, z)\,ds$$

$$I_z = \int_C (x^2 + y^2)\rho(x, y, z)\,ds.$$

Find the moments of inertia for a wire of uniform density $\rho = 1$ in the shape of the helix

$$\mathbf{r}(t) = 3\cos t\,\mathbf{i} + 3\sin t\,\mathbf{j} + 2t\,\mathbf{k}, \quad 0 \le t \le 2\pi \text{ (see figure).}$$

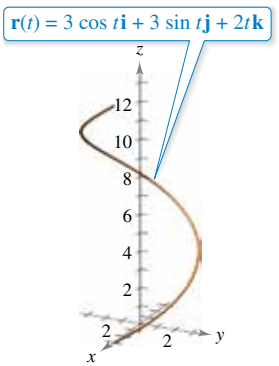


Figure for 5

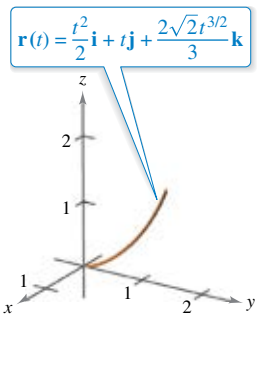

Figure for 6

6. Moments of Inertia Using the formulas from Exercise 5, find the moments of inertia for a wire of density

$$\rho = \frac{1}{1 + t}$$

given by the curve

$$C: \mathbf{r}(t) = \frac{t^2}{2}\mathbf{i} + t\,\mathbf{j} + \frac{2\sqrt{2}t^{3/2}}{3}\mathbf{k}, \quad 0 \le t \le 1 \text{ (see figure).}$$

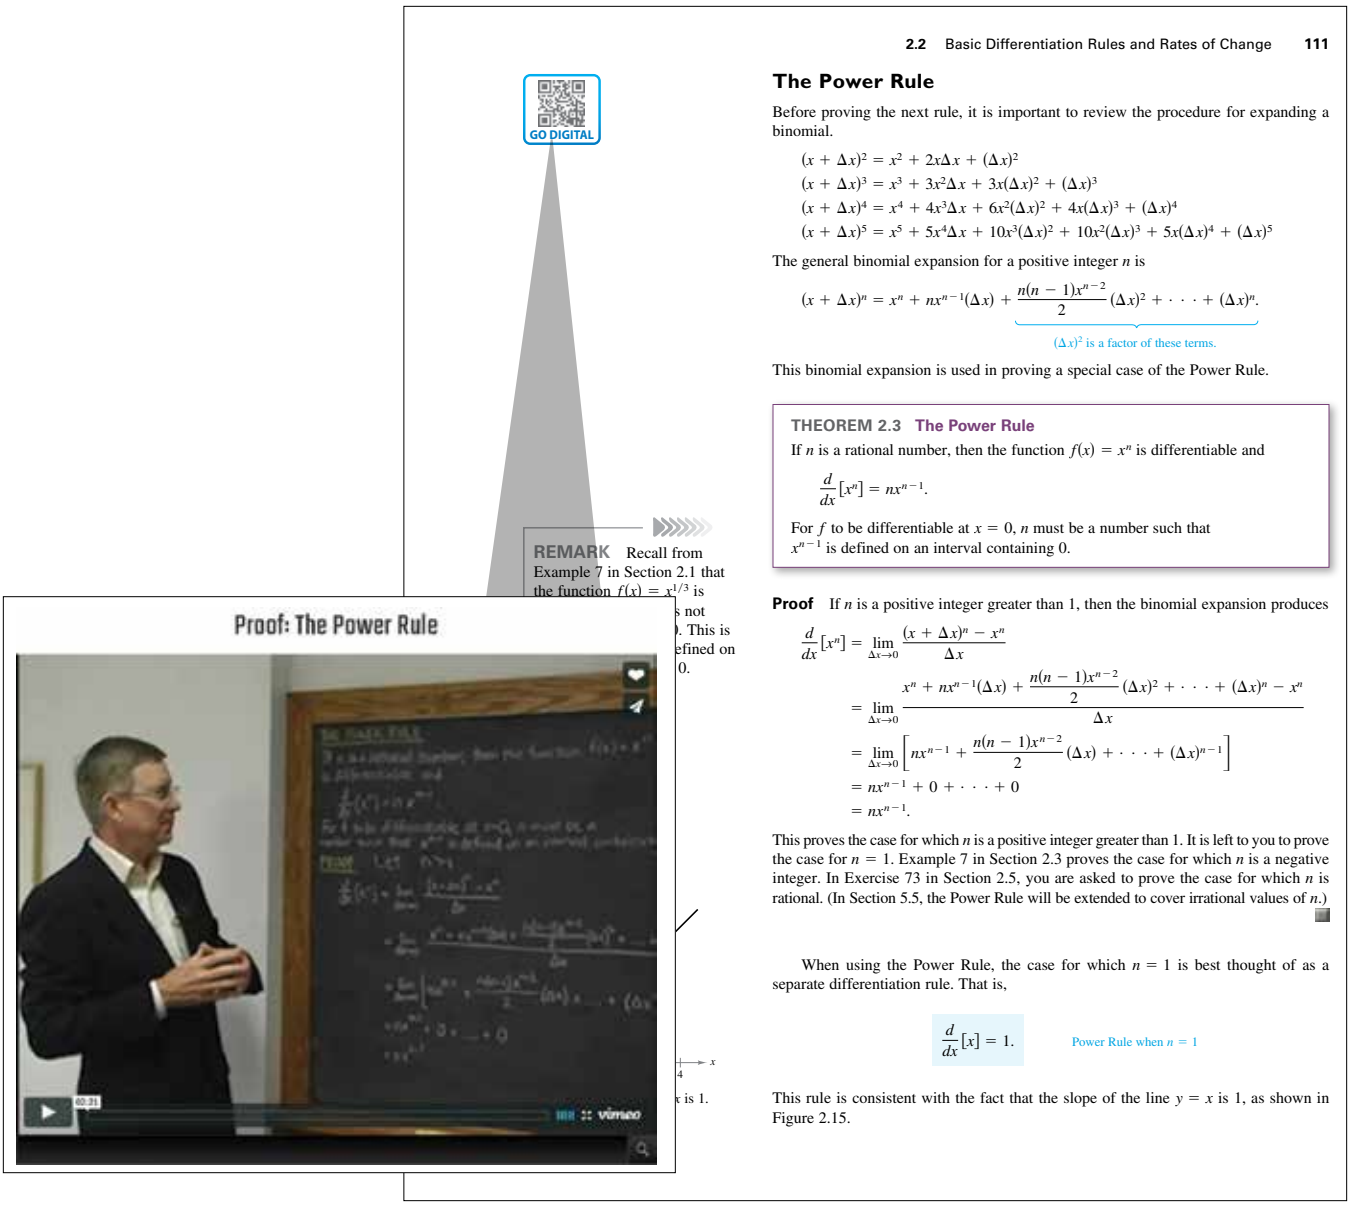
Sample Video: Bruce Edwards's Proof of the Power Rule at *LarsonCalculus.com*



Proof: The Power Rule
GO DIGITAL
2.2 Basic Differentiation Rules and Rates of Change 111
The Power Rule
Before proving the next rule, it is important to review the procedure for expanding a binomial.
$(x + \Delta x)^2 = x^2 + 2x\Delta x + (\Delta x)^2$
$(x + \Delta x)^3 = x^3 + 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$
$(x + \Delta x)^4 = x^4 + 4x^3\Delta x + 6x^2(\Delta x)^2 + 4x(\Delta x)^3 + (\Delta x)^4$
$(x + \Delta x)^5 = x^5 + 5x^4\Delta x + 10x^3(\Delta x)^2 + 10x^2(\Delta x)^3 + 5x(\Delta x)^4 + (\Delta x)^5$
The general binomial expansion for a positive integer n is
$(x + \Delta x)^n = x^n + nx^{n-1}(\Delta x) + \frac{n(n-1)x^{n-2}}{2}(\Delta x)^2 + \cdots + (\Delta x)^n.$
$(\Delta x)^2$ is a factor of these terms.
This binomial expansion is used in proving a special case of the Power Rule.
THEOREM 2.3 The Power Rule
If n is a rational number, then the function $f(x) = x^n$ is differentiable and
$\frac{d}{dx}[x^n] = nx^{n-1}.$
For f to be differentiable at $x = 0$, n must be a number such that x^{n-1} is defined on an interval containing 0.
REMARK Recall from Example 7 in Section 2.1 that the function $f(x) = x^{1/3}$ is
Proof If n is a positive integer greater than 1, then the binomial expansion produces
$\frac{d}{dx}[x^n] = \lim_{\Delta x \to 0} \frac{(x + \Delta x)^n - x^n}{\Delta x}$
$= \lim_{\Delta x \to 0} \frac{x^n + nx^{n-1}(\Delta x) + \frac{n(n-1)x^{n-2}}{2}(\Delta x)^2 + \cdots + (\Delta x)^n - x^n}{\Delta x}$
$= \lim_{\Delta x \to 0} \left[nx^{n-1} + \frac{n(n-1)x^{n-2}}{2}(\Delta x) + \cdots + (\Delta x)^{n-1} \right]$
$= nx^{n-1} + 0 + \cdots + 0$
$= nx^{n-1}.$
This proves the case for which n is a positive integer greater than 1. It is left to you to prove the case for $n = 1$. Example 7 in Section 2.3 proves the case for which n is a negative integer. In Exercise 73 in Section 2.5, you are asked to prove the case for which n is rational. (In Section 5.5, the Power Rule will be extended to cover irrational values of n.)
When using the Power Rule, the case for which $n = 1$ is best thought of as a separate differentiation rule. That is,
$\frac{d}{dx}[x] = 1.$ Power Rule when $n = 1$
This rule is consistent with the fact that the slope of the line $y = x$ is 1, as shown in Figure 2.15.

71. 4480 units

73. Answers will vary. *Sample answer:*
$y = (2x + 3)(x - 4)(2x - 5)$

75. Yes. Assume that the graph has x-axis and origin symmetry. If (x, y) is on the graph, so is $(x, -y)$ by x-axis symmetry. Because $(x, -y)$ is on the graph, then so is $(-x, -(-y)) = (-x, y)$ by origin symmetry. Therefore, the graph is symmetric with respect to the y-axis. The argument is similar for y-axis and origin symmetry.

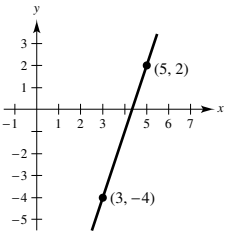
77. False. $(4, -5)$ is not a point on the graph of $x = y^2 - 29$.

79. True

Section P.2 *(page 16)*

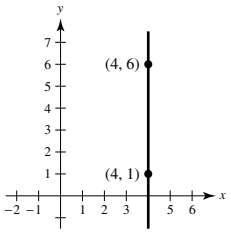
1. Slope; y-intercept **3.** $m = 2$ **5.** $m = -1$

7.



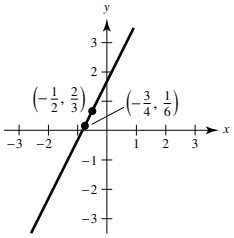
$m = 3$

9.



m is undefined.

11.



$m = 2$

13.

67. $(f \circ g)(x) = x^2$; Domain: $(-\infty, \infty)$
$(g \circ f)(x) = x^2$; Domain: $(-\infty, \infty)$
Yes

69. $(f \circ g)(x) = x$; Domain: $[0, \infty)$
$(g \circ f)(x) = |x|$; Domain: $(-\infty, \infty)$
No, their domains are different.

71. $(f \circ g)(x) = \dfrac{3}{x^2 - 1}$;
Domain: $(-\infty, -1) \cup (-1, 1) \cup (1, \infty)$
$(g \circ f)(x) = \dfrac{9}{x^2} - 1$; Domain: $(-\infty, 0) \cup (0, \infty)$
No

73. (a) 4 (b) -2
(c) Undefined. The graph of g does not exist at $x = -5$.
(d) 3 (e) 2
(f) Undefined. The graph of f does not exist at $x = -4$.

75. Answers will vary.
Sample answer: $f(x) = \sqrt{x}$; $g(x) = 2x - 2$

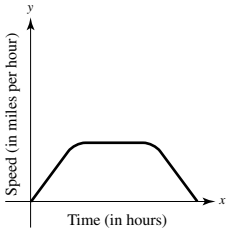
77. (a) $\left(\frac{3}{2}, 4\right)$ (b) $\left(\frac{3}{2}, -4\right)$

79. f is even. g is neither even nor odd. h is odd.

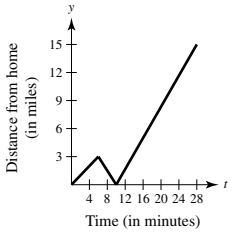
81. Even; zeros: $x = -2, 0, 2$ **83.** Neither; zeros: $x = 0$

85. $f(x) = -5x - 6$, $-2 \le x \le 0$ **87.** $y = -\sqrt{-x}$

89. Answers will vary.
Sample answer:



91. Answers will vary.
Sample answer:



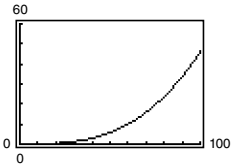
93. $c = 25$

95. No. A graph of a function that is intersected by a horizontal line more than once would mean that there is more than one x-value corresponding to the same y-value.

97. No. Consider $y = x^3 + x + 2$.
$f(-x) \neq -f(x)$
This is an odd-degree function that is not odd.

99. (a) $T(4) = 16°\text{C}$, $T(15) \approx 23°\text{C}$
(b) The changes in temperature occur 1 hour later.
(c) The temperatures are 1° lower.
(d) $T(t) = \begin{cases} 16, & 0 \le t \le 6 \\ 7t - 26, & 6 < t < 7 \\ 23, & 7 \le t \le 20 \\ -7t + 163, & 20 < t < 21 \\ 16, & 21 \le t \le 24 \end{cases}$

101. (a)



(b) $H\left(\dfrac{x}{1.6}\right) = 0.00001132x^3$

103–105. Proofs **107.** $L = \sqrt{x^2 + \left(\dfrac{2x}{x - 3}\right)^2}$

109. False. For example, if $f(x) = x^2$, then $f(-1) = f(1)$.

111. True

113. False. $f(x) = 0$ is symmetric with respect to the x-axis.

115. Putnam Problem A1, 1988

Section P.4 *(page 38)*

1. In general, if θ is any angle, then the angle $\theta + n(2\pi)$, n is a nonzero integer, is coterminal with θ.

3. $\sin\theta = \dfrac{7}{25}$
$\cos\theta = \dfrac{24}{25}$
$\tan\theta = \dfrac{7}{24}$

65. Even; zeros: $x = -1, 0, 1$

67. $\frac{17\pi}{9} \approx 5.934$ **69.** $-\frac{8\pi}{3} \approx -8.378$

71. $30°$ **73.** $-120°$

75. $\sin(-45°) = -\frac{\sqrt{2}}{2}$

$\cos(-45°) = \frac{\sqrt{2}}{2}$

$\tan(-45°) = -1$

77. $\sin\frac{13\pi}{6} = \frac{1}{2}$

$\cos\frac{13\pi}{6} = \frac{\sqrt{3}}{2}$

$\tan\frac{13\pi}{6} = \frac{\sqrt{3}}{3}$

79. $\sin 405° = \frac{\sqrt{2}}{2}$

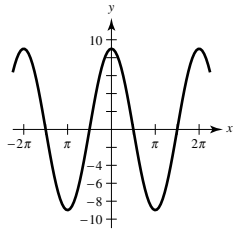
$\cos 405° = \frac{\sqrt{2}}{2}$

$\tan 405° = 1$

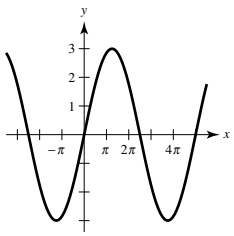
81. 0.6494 **83.** 3.2361 **85.** -0.3420 **87.** $\frac{2\pi}{3}, \frac{4\pi}{3}$

89. $\frac{7\pi}{6}, \frac{3\pi}{2}, \frac{11\pi}{6}$ **91.** $\frac{\pi}{3}, \pi, \frac{5\pi}{3}$

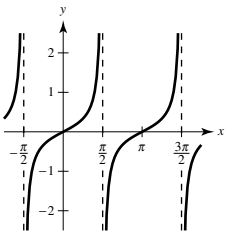
93.



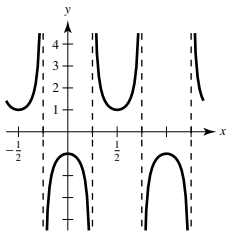
95.



97.



99.



101. (a) $\frac{1}{5}$; greater than (b) $\frac{1}{3}$; less than

(c) $\frac{10}{41}$; greater than (d) $\frac{\sqrt{4+h}-2}{h}$

(e) $\frac{1}{4}$; As h gets closer to 0, the slope gets closer to $\frac{1}{4}$.

P.S. Problem Solving *(page 44)*

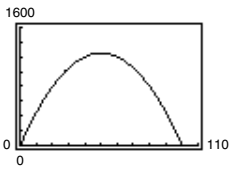
1. (a) Center: $(3, 4)$; Radius: 5

(b) $y = -\frac{3}{4}x$ (c) $y = \frac{3}{4}x - \frac{9}{2}$ (d) $\left(3, -\frac{9}{4}\right)$

3. $T(x) = \dfrac{2\sqrt{4+x^2} + \sqrt{(3-x)^2+1}}{4}$

5. (a) $A(x) = x\left(\dfrac{100-x}{2}\right)$; Domain: $(0, 100)$

(b)



Dimensions 50 m × 25 m yield maximum area of 1250 m².

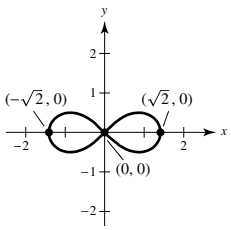
(c) 50 m × 25 m; Area = 1250 m²

7. 80 km/h; Average speed is distance divided by time. Let d be the distance from the starting point to the beach. So, the total round trip distance is $2d$. The time for your drive to the beach is $d/120$ and the time for your drive back is $d/60$. So, simplify the equation

$$\text{Average speed} = \frac{\text{distance}}{\text{time}} = \frac{2d}{d/120 + d/60}$$

to find your average speed.

9. Proof



Chapter 1

Section 1.1 *(page 51)*

1. Calculus is the mathematics of change. Precalculus mathematics is more static.

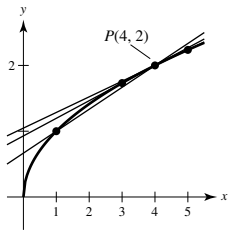
Answers will vary. *Sample answer:*

Precalculus	Calculus
Area of a rectangle	Area under a curve
Work done by a constant force	Work done by a variable force
Center of a rectangle	Centroid of a region

3. Precalculus: 300 ft

5. Calculus: Slope of the tangent line at $x = 2$ is 0.16.

7. (a)



(b) $x = 1$: $m = \frac{1}{3}$

$x = 3$: $m = \dfrac{1}{\sqrt{3}+2} \approx 0.2679$

$x = 5$: $m = \dfrac{1}{\sqrt{5}+2} \approx 0.2361$

(c) $\frac{1}{4}$; You can improve your approximation of the slope at $x = 4$ by considering x-values very close to 4.

9. Area ≈ 10.417; Area ≈ 9.145; Use more rectangles.

11. (a) About 5.66 (b) About 6.11

(c) Increase the number of line segments.

Section 1.2 *(page 59)*

1. As the graph of the function approaches 8 on the horizontal axis, the graph approaches 25 on the vertical axis.

75. 
The graph has a hole at $x = 0$.

Answers will vary. *Sample answer:*

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$f(x)$	0.358	0.354	0.354	0.354	0.353	0.349

$\lim_{x\to 0} \dfrac{\sqrt{x+2}-\sqrt{2}}{x} \approx 0.354$; Actual limit is $\dfrac{1}{2\sqrt{2}} = \dfrac{\sqrt{2}}{4}$.

77. 
The graph has a hole at $x = 0$.

Answers will vary. *Sample answer:*

x	-0.1	-0.01	-0.001
$f(x)$	-0.263	-0.251	-0.250

x	0.001	0.01	0.1
$f(x)$	-0.250	-0.249	-0.238

$\lim_{x\to 0} \dfrac{[1/(2+x)]-(1/2)}{x} \approx -0.250$; Actual limit is $-\dfrac{1}{4}$.

79. 
The graph has a hole at $t = 0$.

Answers will vary. *Sample answer:*

t	-0.1	-0.01	0	0.01	0.1
$f(t)$	2.96	2.9996	?	2.9996	2.96

$\lim_{t\to 0} \dfrac{\sin 3t}{t} \approx 3.0000$; Actual limit is 3.

81. 
The graph has a hole at $x = 0$.

Answers will vary. *Sample answer:*

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$	-0.1	-0.01	-0.001	?	0.001	0.01	0.1

$\lim_{x\to 0} \dfrac{\sin x^2}{x} = 0$; Actual limit is 0.

83. 3 **85.** $2x - 4$ **87.** $x^{-1/2}$

89. $-1/(x+3)^2$ **91.** 4

93. 
0

95. 
0

The graph has a hole at $x = 0$.

97. f and g agree at all but one point if c is a real number such that $f(x) = g(x)$ for all $x \neq c$.

Sample answer: $f(x) = \dfrac{x^2-1}{x-1}$ and $g(x) = x + 1$ agree at all points except $x = 1$.

99. -29.4 m/sec **101.** -64 ft/sec (speed $= 64$ ft/sec)

103. 
The magnitudes of $f(x)$ and $g(x)$ are approximately equal when x is close to 0. Therefore, their ratio is approximately 1.

105. Let $f(x) = 1/x$ and $g(x) = -1/x$.

$\lim_{x\to 0} f(x)$ and $\lim_{x\to 0} g(x)$ do not exist. However,

$\lim_{x\to 0} [f(x) + g(x)] = \lim_{x\to 0} \left[\dfrac{1}{x} + \left(-\dfrac{1}{x}\right)\right] = \lim_{x\to 0} 0 = 0$

and so this limit does exist.

107–111. Proofs

113. The graphing utility was set in *degree* mode instead of *radian* mode.

115. False. The limit does not exist because the function approaches 1 from the right side of 0 and approaches -1 from the left side of 0.

117. True.

119. False. The limit does not exist because $f(x)$ approaches 3 from the left side of 2 and approaches 0 from the right side of 2.

121. Proof

123. (a) All $x \neq 0, \dfrac{\pi}{2} + n\pi$

(b) 
The domain is not obvious. The hole at $x = 0$ is not apparent from the graph.

(c) $\frac{1}{2}$ (d) $\frac{1}{2}$

125. $\lim_{x\to 0} f(x)$ does not exist; $\lim_{x\to 0} g(x) = 0$

Section 1.4 *(page 83)*

1. A function f is continuous at a point c if $f(c)$ is defined, $\lim_{x\to c} f(x)$ exists, and $\lim_{x\to c} f(x) = f(c)$.

3. The limit exists because the limit from the left and the limit from the right are equivalent.

5. (a) 3 (b) 3 (c) 3; $f(x)$ is continuous on $(-\infty, \infty)$.

7. (a) 0 (b) 0 (c) 0; Discontinuity at $x = 3$

9. (a) -3 (b) 3 (c) Limit does not exist.
Discontinuity at $x = 2$

11. $\frac{1}{16}$ **13.** $\frac{1}{10}$ **15.** 0

17. Limit does not exist. The function decreases without bound as x approaches -3 from the left.

19. -1 **21.** 1

23. Limit does not exist. The function decreases without bound as x approaches π from the left and increases without bound as x approaches π from the right.

25. 8 **27.** 2 **29.** $-\frac{1}{x^2}$ **31.** $\frac{5}{2}$ **33.** 2

35. Discontinuities at $x = -2$ and $x = 2$

37. Discontinuities at every integer

39. Continuous on $[-7, 7]$ **41.** Continuous on $[-1, 4]$

43. Nonremovable discontinuity at $x = 0$

45. Continuous for all real x

47. Nonremovable discontinuities at $x = -2$ and $x = 2$

49. Continuous for all real x

51. Nonremovable discontinuity at $x = 1$
Removable discontinuity at $x = 0$

53. Continuous for all real x

55. Removable discontinuity at $x = -2$
Nonremovable discontinuity at $x = 5$

57. Nonremovable discontinuity at $x = -7$

59. Nonremovable discontinuities at integer multiples of $\frac{\pi}{2}$

61. Nonremovable discontinuities at each integer

63. Continuous for all real x

65. Nonremovable discontinuity at $x = 2$

67. Continuous for all real x

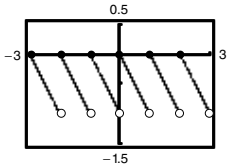
69. $a = 7$ **71.** $a = 2$ **73.** $a = -1, b = 1$

75. Continuous for all real x

77. Nonremovable discontinuities at $x = 1$ and $x = -1$

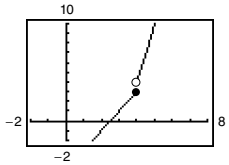
79. Continuous on the open intervals
$\ldots, (-3\pi, -\pi), (-\pi, \pi), (\pi, 3\pi), \ldots$

81.



Nonremovable discontinuity at each integer

83.



Nonremovable discontinuity at $x = 4$

85. Continuous on $(-\infty, \infty)$ **87.** Continuous on $[0, \infty)$

89. Continuous on the open intervals $\ldots, (-6, -2), (-2, 2), (2, 6), \ldots$

91. Continuous on $(-\infty, \infty)$

93. Because $f(x)$ is continuous on the interval $[1, 2]$ and $f(1) = \frac{37}{12}$ and $f(2) = -\frac{8}{3}$, by the Intermediate Value Theorem there exists a real number c in $[1, 2]$ such that $f(c) = 0$.

95. Because $f(x)$ is continuous on the interval $[0, \pi]$ and $f(0) = -3$ and $f(\pi) \approx 8.87$, by the Intermediate Value Theorem there exists a real number c in $[0, \pi]$ such that $f(c) = 0$.

97. Consider the intervals $[1, 3]$ and $[3, 5]$.
$f(1) = 2 > 0$ and $f(3) = -2 < 0$. So, there is at least one zero in the interval $[1, 3]$.
$f(3) = -2 < 0$ and $f(5) = 2 > 0$. So, there is at least one zero in the interval $[3, 5]$.

99. 0.68, 0.6823 **101.** 0.56, 0.5636 **103.** 0.95, 0.9472

105. $f(3) = 11$; $c = 3$

107. $f(0) \approx 0.6458$, $f(5) \approx 1.464$; $c = 2$

109. $f(1) = 0$, $f(3) = 24$; $c = 2$

111. (a) Answers will vary. *Sample answer*:
$$f(x) = \frac{1}{(x - a)(x - b)}$$
(b) Answers will vary. *Sample answer:*
$$g(x) = \begin{cases} -1 & -2 \le x < 0 \\ 1 & 0 \le x \le 2 \end{cases}$$
No; The function g is not continuous at $x = 0$.

113. If f and g are continuous for all real x, then so is $f + g$ (Theorem 1.11, part 2). However, $\frac{f}{g}$ might not be continuous if $g(x) = 0$. For example, let $f(x) = x$ and $g(x) = x^2 - 1$. Then f and g are continuous for all real x, but $\frac{f}{g}$ is not continuous at $x = \pm 1$.

115. True

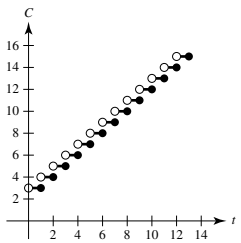
117. False. $f(x) = \cos x$ has two zeros in $[0, 2\pi]$. However, $f(0)$ and $f(2\pi)$ have the same sign.

119. False. A rational function can be written as $\frac{P(x)}{Q(x)}$, where P and Q are polynomials of degree m and n, respectively. It can have, at most, n discontinuities.

121. The functions differ by 1 for non-integer values of x.

123. (a) $C(t) = 3 - [\![1 - t]\!]$, $0 < t \le 13$

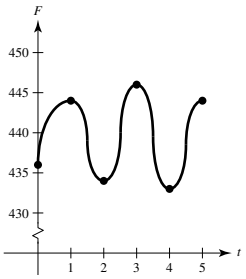
(b)



There is a nonremovable discontinuity at every integer value of t, or hour.

125–127. Proofs **129.** Answers will vary.

131. (a)

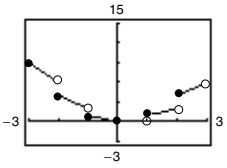


(b) No. The frequency is oscillating.

133. (a) $c = 0$, 1, or 2
(b) $c = \frac{-1 \pm \sqrt{5}}{2}$

135. Proof

137. $h(x)$ has a nonremovable discontinuity at every integer except 0.



139. Putnam Problem B2, 1988

Section 1.5 *(page 92)*

1. A limit in which $f(x)$ increases or decreases without bound as x approaches c is called an infinite limit. ∞ is not a number. Rather, the symbol $\lim_{x\to c} f(x) = \infty$ says how the limit fails to exist.

3. $\lim_{x\to -2^+} 2\left|\frac{x}{x^2-4}\right| = \infty, \quad \lim_{x\to -2^-} 2\left|\frac{x}{x^2-4}\right| = \infty$

5. $\lim_{x\to -2^+} \tan\frac{\pi x}{4} = -\infty, \quad \lim_{x\to -2^-} \tan\frac{\pi x}{4} = \infty$

7. $\lim_{x\to 4^+} \frac{1}{x-4} = \infty, \quad \lim_{x\to 4^-} \frac{1}{x-4} = -\infty$

9. $\lim_{x\to 4^+} \frac{1}{(x-4)^2} = \infty, \quad \lim_{x\to 4^-} \frac{1}{(x-4)^2} = \infty$

11.

x	-3.5	-3.1	-3.01	-3.001	-3

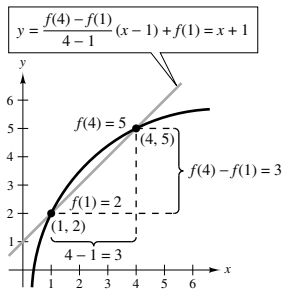
3. (a) $m = -\frac{12}{5}$ (b) $y = \frac{5}{12}x - \frac{169}{12}$
(c) $m_x = \dfrac{-\sqrt{169 - x^2} + 12}{x - 5}$
(d) $\frac{5}{12}$; It is the same as the slope of the tangent line found in part (b).
5. $a = 3, b = 6$ **7.** Proof

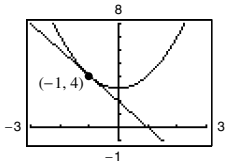
Chapter 2

Section 2.1 *(page 107)*

1. Let $(c, f(c))$ represent an arbitrary point on the graph of f. Then the slope of the tangent line at $(c, f(c))$ is
$m = \lim_{\Delta x \to 0} \dfrac{f(c + \Delta x) - f(c)}{\Delta x}$.
3. The limit used to define the slope of a tangent line is also used to define differentiation. The key is to rewrite the difference quotient so that Δx does not occur as a factor of the denominator.
5. $m_1 = 0, m_2 = 5/2$
7. (a)–(d)



9. $m = -5$
11. $m = 8$ **13.** $m = 3$ **15.** $f'(x) = 0$
17. $f'(x) = -5$ **19.** $h'(s) = \frac{2}{3}$ **21.** $f'(x) = 2x + 1$
23. $f'(x) = 3x^2 - 12$ **25.** $f'(x) = \dfrac{-1}{(x - 1)^2}$
27. $f'(x) = \dfrac{1}{2\sqrt{x + 4}}$
29. (a) Tangent line: $y = -2x + 2$
(b)



31. (a) Tangent line: $y = 12x - 16$
(b)

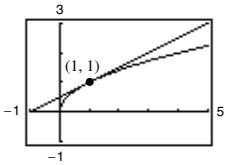
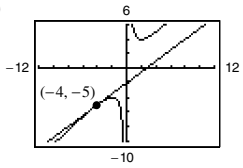
33. (a) Tangent line: $y = \frac{1}{2}x + \frac{1}{2}$

(b)



35. (a) Tangent line: $y = \frac{3}{4}x - 2$

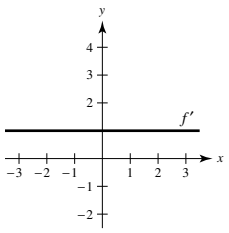
(b)



37. $y = -x + 1$ **39.** $y = 3x - 2$; $y = 3x + 2$

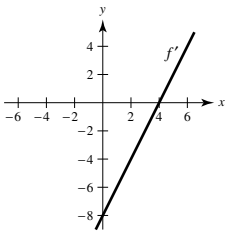
41. $y = -\frac{1}{2}x + \frac{3}{2}$

43.



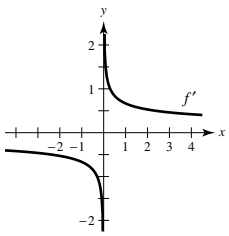
The slope of the graph of f is 1 for all x-values.

45.



The slope of the graph of f is negative for $x < 4$, positive for $x > 4$, and 0 at $x = 4$.

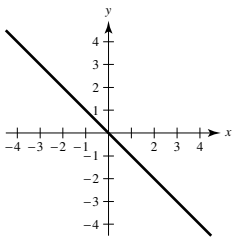
47.



The slope of the graph of f is negative for $x < 0$ and positive for $x > 0$. The slope is undefined at $x = 0$.

49. Answers will vary.

Sample answer: $y = -x$



51. No. Consider $f(x) = \sqrt{x}$ and its derivative.

53. $g(4) = 5$; $g'(4) = -\frac{5}{3}$

55. $f(x) = 5 - 3x$

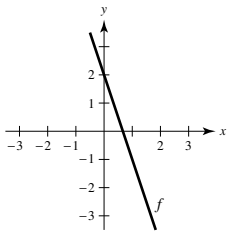
$c = 1$

57. $f(x) = -x^2$

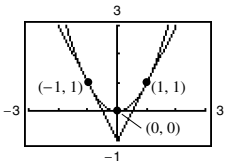
$c = 6$

59. $f(x) = -3x + 2$

61. $y = 2x + 1$, $y = -2x + 9$

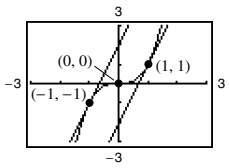


63. (a)



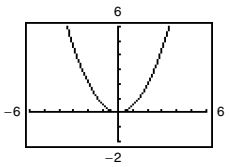
For this function, the slopes of the tangent lines are always distinct for different values of x.

(b)



For this function, the slopes of the tangent lines are sometimes the same.

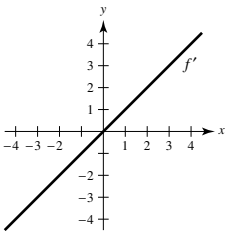
65. (a)



$f'(0) = 0$, $f'\left(\frac{1}{2}\right) = \frac{1}{2}$, $f'(1) = 1$, $f'(2) = 2$

(b) $f'\left(-\frac{1}{2}\right) = -\frac{1}{2}$, $f'(-1) = -1$, $f'(-2) = -2$

(c)



(d) $f'(x) = x$

67. $f(2) = 4$, $f(2.1) = 3.99$, $f'(2) \approx -0.1$ **69.** 6 **71.** 4

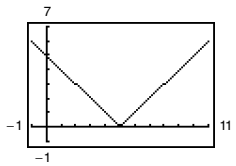
73. $g(x)$ is not differentiable at $x = 0$.

75. $f(x)$ is not differentiable at $x = 6$.

77. $h(x)$ is not differentiable at $x = -7$.

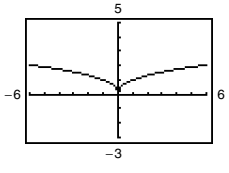
79. $(-\infty, -4) \cup (-4, \infty)$ **81.** $(-1, \infty)$

83.



$(-\infty, 5) \cup (5, \infty)$

85.



$(-\infty, 0) \cup (0, \infty)$

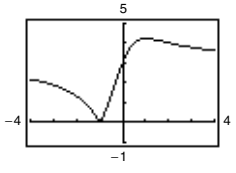
87. The derivative from the left is -1 and the derivative from the right is 1, so f is not differentiable at $x = 1$.

89. The derivatives from both the right and the left are 0, so $f'(1) = 0$.

91. f is differentiable at $x = 2$.

93. (a) $d = \dfrac{3|m + 1|}{\sqrt{m^2 + 1}}$

(b)



Not differentiable at $m = -1$

95. False. The slope is $\lim_{\Delta x \to 0} \dfrac{f(2 + \Delta x) - f(2)}{\Delta x}$.

97. False. For example, $f(x) = |x|$. The derivative from the left and the derivative from the right both exist but are not equal.

99. Proof

(c) $\left(\frac{28}{17}, -\frac{46}{17}\right)$

Section 2.6 *(page 157)*

1. A related-rate equation is an equation that relates the rates of change of various quantities.

3. (a) $\frac{3}{4}$ (b) 20 **5.** (a) $-\frac{5}{8}$ (b) $\frac{3}{2}$

7. (a) -8 cm/sec
(b) 0 cm/sec
(c) 8 cm/sec

9. (a) 12 ft/sec
(b) 6 ft/sec
(c) 3 ft/sec

11. 296π cm^2/min

13. (a) 972π in.^{3}/min, $15{,}552\pi$ in.^{3}/min
(b) If $\dfrac{dr}{dt}$ is constant, $\dfrac{dV}{dt}$ is proportional to r^2.

15. (a) 72 cm^3/sec
(b) 1800 cm^3/sec

17. $\dfrac{8}{405\pi}$ ft/min

19. (a) 12.5% (b) $\dfrac{1}{144}$ m/min

21. (a) $-\frac{7}{12}$ ft/sec, $-\frac{3}{2}$ ft/sec, $-\frac{48}{7}$ ft/sec
(b) $\frac{527}{24}$ ft^2/sec (c) $\frac{1}{12}$ rad/sec

23. Rate of vertical change: $\dfrac{1}{5}$ m/sec

Rate of horizontal change: $-\dfrac{\sqrt{3}}{15}$ m/sec

25. (a) -750 mi/h (b) 30 min

27. $-\dfrac{50}{\sqrt{85}} \approx -5.42$ ft/sec

29. (a) $\frac{25}{3}$ ft/sec (b) $\frac{10}{3}$ ft/sec

31. (a) 12 sec (b) $\dfrac{1}{2}\sqrt{3}$ m (c) $\dfrac{\sqrt{5}\pi}{120}$ m/sec

33. Evaporation rate proportional to $S \implies \dfrac{dV}{dt} = k(4\pi r^2)$

$V = \left(\dfrac{4}{3}\right)\pi r^3 \implies \dfrac{dV}{dt} = 4\pi r^2 \dfrac{dr}{dt}$. So $k = \dfrac{dr}{dt}$.

35. (a) $\dfrac{dy}{dt} = 3\dfrac{dx}{dt}$ means that y changes three times as fast as x changes.
(b) y changes slowly when $x \approx 0$ or $x \approx L$. y changes more rapidly when x is near the middle of the interval.

37. 0.6 ohm/sec **39.** About 84.9797 mi/h

41. $\dfrac{2\sqrt{21}}{525} \approx 0.017$ rad/sec

43. (a) $\dfrac{200\pi}{3}$ ft/sec (b) 200π ft/sec
(c) About 427.43π ft/sec

45. (a) Proof (b) $\dfrac{\sqrt{3}s^2}{8}, \dfrac{s^2}{8}$

47. (a) $r(f) = -0.0406f^3 + 1.974f^2 - 31.21f + 161.6$
(b) $\dfrac{dr}{dt} = (-0.1218f^2 + 3.948f - 31.21)\dfrac{df}{dt}$,
-0.2899 million participants/yr

49. -0.1808 ft/sec^2

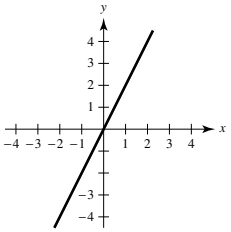
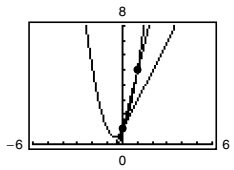
Review Exercises for Chapter 2 *(page 161)*

1. (a) 80, 144, 80
(b) -32, calculus is not needed
(c) -64, calculus is needed
(d) Limits allow you to find the derivative of a function, and with the derivative, you can now find the instantaneous velocity of the car.

3. Answers will vary.
Sample answer: $y = 2x$



5. Answers will vary. *Sample answer:*
$p(x) = 2x^2 + 2x + 1$
$(c, p(c)) = (0, 1)$
$(c + h, p(c + h)) = (1, 5)$
Tangent Line: $y = 2x + 1$
Secant Line: $y = 4x + 1$
(a)



(b) Answers will vary.
(c) Answers will vary.

7. 0 **9.** $3x^2 - 2$ **11.** 5

13. f is differentiable at all $x \neq 3$. **15.** 0

17. $3x^2 - 22x$ **19.** $\frac{3}{\sqrt{x}} + \frac{1}{\sqrt[3]{x^2}}$ **21.** $-\frac{4}{3t^3}$

23. $4 - 5\cos\theta$ **25.** $-3\sin\theta - \frac{\cos\theta}{4}$

27. -1 **29.** 2

31. (a) 50 vibrations/sec/lb
(b) 33.33 vibrations/sec/lb

33. (a) $s(t) = -16t^2 - 30t + 600$
$v(t) = -32t - 30$
(b) -94 ft/sec
(c) $v(1) = -62$ ft/sec, $v(3) = -126$ ft/sec
(d) About 5.258 sec
(e) About -198.256 ft/sec

35. $4(5x^3 - 15x^2 - 11x - 8)$

37. $9x\cos x - \cos x + 9\sin x$

39. $\frac{-(x^2 + 1)}{(x^2 - 1)^2}$ **41.** $\frac{4x^3\cos x + x^4\sin x}{\cos^2 x}$

43. $3x^2\sec x\tan x + 6x\sec x$ **45.** $-x\sin x$

47. $y = 4x + 10$ **49.** $y = -8x + 1$ **51.** $-48t$

53. $\frac{225}{4}\sqrt{x}$ **55.** $6\sec^2\theta\tan\theta$ **57.** $8\cot x\csc^2 x$

59. $v(3) = 11$ m/sec, $a(3) = -6$ m/sec^2 **61.** $28(7x + 3)^3$

63. $-\frac{6x}{(x^2 + 5)^4}$ **65.** $-45\sin(9x + 1)$

67. $\frac{1}{2}(1 - \cos 2x)$, or $\sin^2 x$ **69.** $(36x + 1)(6x + 1)^4$

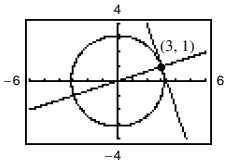
71. $\frac{3x^2(x + 10)}{2(x + 5)^{5/2}}$ **73.** -2 **75.** -11 **77.** 0

79. $384(8x + 5)$ **81.** $2\csc^2 x\cot x$

83. (a) -18.667°F/h
(b) -7.284°F/h
(c) -3.240°F/h
(d) -0.747°F/h

85. $-\frac{x}{y}$ **87.** $\frac{y(y^2 - 3x^2)}{x(x^2 - 3y^2)}$ **89.** $\frac{y\sin x + \sin y}{\cos x - x\cos y}$

91. Tangent line: $3x + y - 10 = 0$
Normal line: $x - 3y = 0$



93. $2\sqrt{2}$ units/sec, 4 units/sec, 8 units/sec

95. 450π km/h

97. (a) $j(t)$ is the rate of change of acceleration.
(b) $j(t) = 0$, so the acceleration is constant.

P.S. Problem Solving *(page 164)*

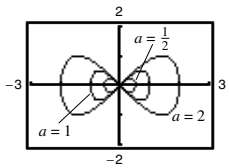
1. (a) $r = \frac{1}{2}$; $x^2 + \left(y - \frac{1}{2}\right)^2 = \frac{1}{4}$
(b) Center: $\left(0, \frac{5}{4}\right)$; $x^2 + \left(y - \frac{5}{4}\right)^2 = 1$

3. $p(x) = 2x^3 + 4x^2 - 5$

5. (a) $v(t) = -\frac{27}{5}t + 27$ ft/sec
$a(t) = -\frac{27}{5}$ ft/sec^2
(b) 5 sec; 73.5 ft
(c) The acceleration due to gravity on Earth is greater in magnitude than that on the moon.

7. (a) Graph $\begin{cases} y_1 = \frac{1}{a}\sqrt{x^2(a^2 - x^2)} \\ y_2 = -\frac{1}{a}\sqrt{x^2(a^2 - x^2)} \end{cases}$ as separate equations.

(b) Answers will vary. *Sample answer:*



The intercepts will always be $(0, 0)$, $(a, 0)$, and $(-a, 0)$, and the maximum and minimum y-values appear to be $\pm\frac{1}{2}a$.

(c) $\left(\frac{a\sqrt{2}}{2}, \frac{a}{2}\right)$, $\left(\frac{a\sqrt{2}}{2}, -\frac{a}{2}\right)$, $\left(-\frac{a\sqrt{2}}{2}, \frac{a}{2}\right)$, $\left(-\frac{a\sqrt{2}}{2}, -\frac{a}{2}\right)$

9. Proof; The graph of L is a line passing through the origin $(0, 0)$.

Chapter 3

Section 3.1 *(page 171)*

1. $f(c)$ is the low point of the graph of f on the interval I.

3. A relative maximum is a peak of the graph. An absolute maximum is the greatest value on the interval I.

5. Find all x-values for which $f'(x) = 0$ and all x-values for which $f'(x)$ does not exist.

7. $f'(0) = 0$ **9.** $g'(2) = 0$ **11.** $f'(-2)$ is undefined.

13. 2, absolute maximum (and relative maximum)

15. 1, absolute maximum (and relative maximum);
2, absolute minimum (and relative minimum);
3, absolute maximum (and relative maximum)

17. $x = \frac{3}{4}$ **19.** $t = \frac{8}{3}$ **21.** $x = \frac{\pi}{3}, \pi, \frac{5\pi}{3}$

23. Minimum: $(2, 1)$
Maximum: $(-1, 4)$

25. Minimum: $(-3, -13)$
Maximum: $(0, 5)$

27. Minimum: $\left(-1, -\frac{5}{2}\right)$
Maximum: $(2, 2)$

29. Minimum: $(0, 0)$
Maximum: $(-1, 5)$

31. Minima: $(1, -6)$ and $(-2, -6)$
Maximum: $(0, 0)$

33. Minimum: $(-1, -1)$
Maximum: $(3, 3)$

35. Minimum value is -2 for $-2 \le x < -1$.
Maximum: $(2, 2)$

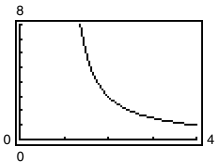
37. Minimum: $\left(\frac{3\pi}{2}, -1\right)$
Maximum: $\left(\frac{5\pi}{6}, \frac{1}{2}\right)$

39. Minimum: $(\pi, -3)$
Maxima: $(0, 3)$ and $(2\pi, 3)$

41. (a) Minimum: $(0, -3)$
Maximum: $(2, 1)$
(b) Minimum: $(0, -3)$
(c) Maximum: $(2, 1)$
(d) No extrema

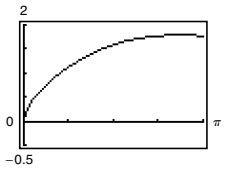
43. (a) Minimum: $(1, -1)$
Maximum: $(-1, 3)$
(b) Maximum: $(3, 3)$
(c) Minimum: $(1, -1)$
(d) Minimum: $(1, -1)$

45.



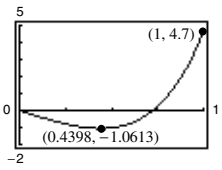
Minimum: $(4, 1)$

47.



Minimum: $(0, 0)$
Maximum: $(2.7149, 1.7856)$

49. (a)

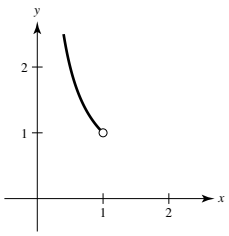


(b) Minimum: $(0.4398, -1.0613)$

51. Maximum: $\left|f''\left(\sqrt[3]{-10 + \sqrt{108}}\right)\right| = f''\left(\sqrt{3} - 1\right) \approx 1.47$

53. Maximum: $\left|f^{(4)}(0)\right| = \frac{56}{81}$

55. Answers will vary. *Sample answer:* Let $f(x) = \frac{1}{x}$. f is continuous on $(0, 1)$ but does not have a maximum or minimum.



57. (a) Yes. The value is defined.
(b) No. The value is undefined.

59. No. The function is not defined at $x = -2$.

61. Maximum: $P(12) = 72$; No. P is decreasing for $I > 12$.

63. $\theta = \text{arcsec}\ \sqrt{3} \approx 0.9553$ rad

65. False. The maximum would be 9 if the interval was closed.

67. True **69.** Proof **71.** Putnam Problem B3, 2004

Section 3.2 *(page 178)*

1. Rolle's Theorem gives conditions that guarantee the existence of an extreme value in the interior of a closed interval.

3. $f(-1) = f(1) = 1$; f is not continuous on $[-1, 1]$.

5. $f(0) = f(2) = 0$; f is not differentiable on $(0, 2)$.

7. $(2, 0), (-1, 0)$; $f'\left(\frac{1}{2}\right) = 0$ **9.** $(0, 0), (-4, 0)$; $f'\left(-\frac{8}{3}\right) = 0$

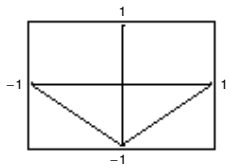
11. $f'\left(\frac{3}{2}\right) = 0$ **13.** $f'\left(\frac{6 - \sqrt{3}}{3}\right) = 0$; $f'\left(\frac{6 + \sqrt{3}}{3}\right) = 0$

15. Not differentiable at $x = 0$ **17.** $f'\left(-2 + \sqrt{5}\right) = 0$

19. $f'\left(\frac{\pi}{2}\right) = 0$; $f'\left(\frac{3\pi}{2}\right) = 0$ **21.** $f'(1) = 0$

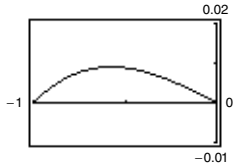
23. Not continuous on $[0, \pi]$

25.



Rolle's Theorem does not apply.

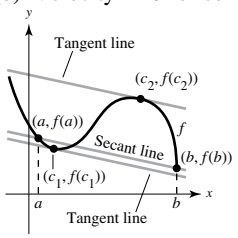
27.



$f'\left(-\frac{6}{\pi}\arccos\frac{3}{\pi}\right) = 0$

29. (a) $f(1) = f(2) = 38$
(b) Velocity $= 0$ for some t in $(1, 2)$; $t = \frac{3}{2}$ sec

31.



33. The function is not continuous on $[0, 6]$.

35. The function is not continuous on $[0, 6]$.

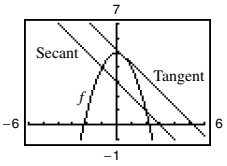
37. (a) Secant line: $x + y - 3 = 0$ (b) $c = \frac{1}{2}$
(c) Tangent line: $4x + 4y - 21 = 0$
(d)

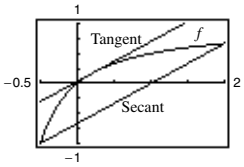


39. $f'\left(\frac{\sqrt{21}}{3}\right) = 42$ **41.** $f'\left(-\frac{\sqrt{3}}{3}\right) = 3$

43. f is not continuous at $x = 1$.

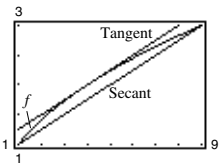
45. f is not differentiable at $x = -\frac{1}{2}$. **47.** $f'\left(\frac{\pi}{2}\right) = 0$

49. (a)–(c)



(b) $y = \frac{2}{3}(x - 1)$
(c) $y = \frac{1}{3}\left(2x + 5 - 2\sqrt{6}\right)$

51. (a)–(c)



(b) $y = \frac{1}{4}x + \frac{3}{4}$
(c) $y = \frac{1}{4}x + 1$

53. (a) -14.7 m/sec (b) 1.5 sec

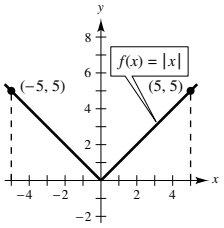
55. No. Let $f(x) = x^2$ on $[-1, 2]$.

57. No. $f(x)$ is not continuous on $[0, 1]$. So it does not satisfy the hypothesis of Rolle's Theorem.

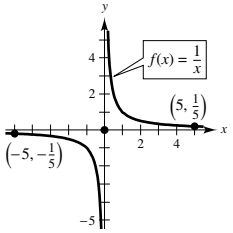
59. By the Mean Value Theorem, there is a time when the speed of the plane must equal the average speed of 454.5 miles/hour. The speed was 400 miles/hour when the plane was accelerating to 454.5 miles/hour and decelerating from 454.5 miles/hour.

61. Proof

63. (a) Answers will vary. *Sample answer:*



(b)



65–67. Proofs **69.** $f(x) = 5$; $f(x) = c$ and $f(2) = 5$.

71. $f(x) = x^2 - 1$; $f(x) = x^2 + c$ and $f(1) = 0$, so $c = -1$.

73. False. f is not continuous on $[-1, 1]$. **75.** True

77–83. Proofs

Section 3.3 *(page 187)*

1. A positive derivative of a function on an open interval implies that the function is increasing on the interval. A negative derivative implies that the function is decreasing. A zero derivative implies that the function is constant.

3. (a) $(0, 6)$ (b) $(6, 8)$

5. Increasing on $(-\infty, -1)$; Decreasing on $(-1, \infty)$

7. Increasing on $(-\infty, -2)$ and $(2, \infty)$; Decreasing on $(-2, 2)$

9. Increasing on $(-\infty, -1)$; Decreasing on $(-1, \infty)$

11. Increasing on $(1, \infty)$; Decreasing on $(-\infty, 1)$

13. Increasing on $\left(-2\sqrt{2}, 2\sqrt{2}\right)$;
Decreasing on $\left(-4, -2\sqrt{2}\right)$ and $\left(2\sqrt{2}, 4\right)$

15. Increasing on $\left(0, \frac{\pi}{2}\right)$ and $\left(\frac{3\pi}{2}, 2\pi\right)$;
Decreasing on $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$

17. Increasing on $\left(0, \frac{7\pi}{6}\right)$ and $\left(\frac{11\pi}{6}, 2\pi\right)$;
Decreasing on $\left(\frac{7\pi}{6}, \frac{11\pi}{6}\right)$

19. (a) Critical number: $x = 4$
(b) Increasing on $(4, \infty)$; Decreasing on $(-\infty, 4)$
(c) Relative minimum: $(4, -16)$

21. (a) Critical number: $x = 1$
(b) Increasing on $(-\infty, 1)$; Decreasing on $(1, \infty)$
(c) Relative maximum: $(1, 5)$

23. (a) Critical numbers: $x = -1, 1$
(b) Increasing on $(-1, 1)$;
Decreasing on $(-\infty, -1)$ and $(1, \infty)$
(c) Relative maximum: $(1, 17)$;
Relative minimum: $(-1, -11)$

25. (a) Critical numbers: $x = -\frac{5}{3}, 1$
(b) Increasing on $\left(-\infty, -\frac{5}{3}\right), (1, \infty)$;
Decreasing on $\left(-\frac{5}{3}, 1\right)$
(c) Relative maximum: $\left(-\frac{5}{3}, \frac{256}{27}\right)$;
Relative minimum: $(1, 0)$

27. (a) Critical numbers: $x = \pm 1$
(b) Increasing on $(-\infty, -1)$ and $(1, \infty)$;
Decreasing on $(-1, 1)$
(c) Relative maximum: $\left(-1, \frac{4}{5}\right)$; Relative minimum: $\left(1, -\frac{4}{5}\right)$

29. (a) Critical number: $x = 0$
(b) Increasing on $(-\infty, \infty)$
(c) No relative extrema

31. (a) Critical number: $x = -2$
(b) Increasing on $(-2, \infty)$; Decreasing on $(-\infty, -2)$
(c) Relative minimum: $(-2, 0)$

33. (a) Critical number: $x = 5$
(b) Increasing on $(-\infty, 5)$; Decreasing on $(5, \infty)$
(c) Relative maximum: $(5, 5)$

35. (a) Critical numbers: $x = \pm\frac{\sqrt{2}}{2}$; Discontinuity: $x = 0$
(b) Increasing on $\left(-\infty, -\frac{\sqrt{2}}{2}\right)$ and $\left(\frac{\sqrt{2}}{2}, \infty\right)$;
Decreasing on $\left(-\frac{\sqrt{2}}{2}, 0\right)$ and $\left(0, \frac{\sqrt{2}}{2}\right)$
(c) Relative maximum: $\left(-\frac{\sqrt{2}}{2}, -2\sqrt{2}\right)$;
Relative minimum: $\left(\frac{\sqrt{2}}{2}, 2\sqrt{2}\right)$

37. (a) Critical number: $x = 0$; Discontinuities: $x = \pm 3$
(b) Increasing on $(-\infty, -3)$ and $(-3, 0)$;
Decreasing on $(0, 3)$ and $(3, \infty)$
(c) Relative maximum: $(0, 0)$

39. (a) Critical number: $x = 0$
(b) Increasing on $(-\infty, 0)$; Decreasing on $(0, \infty)$
(c) Relative maximum: $(0, 4)$

41. (a) Critical numbers: $x = \frac{\pi}{3}, \frac{5\pi}{3}$; Increasing on $\left(\frac{\pi}{3}, \frac{5\pi}{3}\right)$;
Decreasing on $\left(0, \frac{\pi}{3}\right)$ and $\left(\frac{5\pi}{3}, 2\pi\right)$

(b) Relative maximum: $\left(\frac{5\pi}{3}, \frac{5\pi}{3} + \sqrt{3}\right)$;
Relative minimum: $\left(\frac{\pi}{3}, \frac{\pi}{3} - \sqrt{3}\right)$

43. (a) Critical numbers: $x = \frac{\pi}{4}, \frac{5\pi}{4}$;
Increasing on $\left(0, \frac{\pi}{4}\right), \left(\frac{5\pi}{4}, 2\pi\right)$;
Decreasing on $\left(\frac{\pi}{4}, \frac{5\pi}{4}\right)$

(b) Relative maximum: $\left(\frac{\pi}{4}, \sqrt{2}\right)$;
Relative minimum: $\left(\frac{5\pi}{4}, -\sqrt{2}\right)$

45. (a) Critical numbers:
$x = \frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4}, \pi, \frac{5\pi}{4}, \frac{3\pi}{2}, \frac{7\pi}{4}$;
Increasing on $\left(\frac{\pi}{4}, \frac{\pi}{2}\right), \left(\frac{3\pi}{4}, \pi\right), \left(\frac{5\pi}{4}, \frac{3\pi}{2}\right), \left(\frac{7\pi}{4}, 2\pi\right)$;
Decreasing on $\left(0, \frac{\pi}{4}\right), \left(\frac{\pi}{2}, \frac{3\pi}{4}\right), \left(\pi, \frac{5\pi}{4}\right), \left(\frac{3\pi}{2}, \frac{7\pi}{4}\right)$

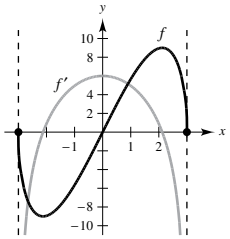
(b) Relative maxima: $\left(\frac{\pi}{2}, 1\right), (\pi, 1), \left(\frac{3\pi}{2}, 1\right)$;
Relative minima: $\left(\frac{\pi}{4}, 0\right), \left(\frac{3\pi}{4}, 0\right), \left(\frac{5\pi}{4}, 0\right), \left(\frac{7\pi}{4}, 0\right)$

47. (a) Critical numbers: $\frac{\pi}{2}, \frac{7\pi}{6}, \frac{3\pi}{2}, \frac{11\pi}{6}$;
Increasing on $\left(0, \frac{\pi}{2}\right), \left(\frac{7\pi}{6}, \frac{3\pi}{2}\right), \left(\frac{11\pi}{6}, 2\pi\right)$;
Decreasing on $\left(\frac{\pi}{2}, \frac{7\pi}{6}\right), \left(\frac{3\pi}{2}, \frac{11\pi}{6}\right)$

(b) Relative maxima: $\left(\frac{\pi}{2}, 2\right), \left(\frac{3\pi}{2}, 0\right)$;
Relative minima: $\left(\frac{7\pi}{6}, -\frac{1}{4}\right), \left(\frac{11\pi}{6}, -\frac{1}{4}\right)$

49. (a) $f'(x) = \dfrac{2(9 - 2x^2)}{\sqrt{9 - x^2}}$

(b)

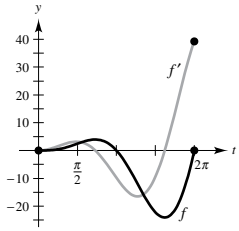


(c) Critical numbers: $x = \pm\frac{3\sqrt{2}}{2}$

(d) $f' > 0$ on $\left(-\frac{3\sqrt{2}}{2}, \frac{3\sqrt{2}}{2}\right)$;
$f' < 0$ on $\left(-3, -\frac{3\sqrt{2}}{2}\right), \left(\frac{3\sqrt{2}}{2}, 3\right)$;
f is increasing when f' is positive and decreasing when f' is negative.

51. (a) $f'(t) = t(t\cos t + 2\sin t)$

(b)

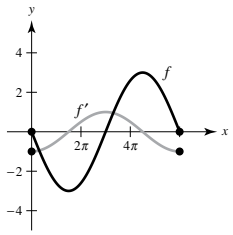


(c) Critical numbers: $t = 2.2889, 5.0870$

(d) $f' > 0$ on $(0, 2.2889)$, $(5.0870, 2\pi)$; $f' < 0$ on $(2.2889, 5.0870)$; f is increasing when f' is positive and decreasing when f' is negative.

53. (a) $f'(x) = -\cos\dfrac{x}{3}$

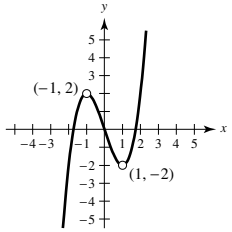
(b)



(c) Critical numbers: $x = \frac{3\pi}{2}, \frac{9\pi}{2}$

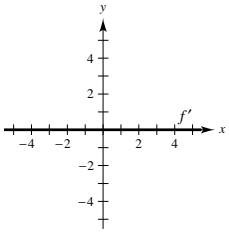
(d) $f' > 0$ on $\left(\frac{3\pi}{2}, \frac{9\pi}{2}\right)$; $f' < 0$ on $\left(0, \frac{3\pi}{2}\right), \left(\frac{9\pi}{2}, 6\pi\right)$;
f is increasing when f' is positive and decreasing when f' is negative.

55. $f(x)$ is symmetric with respect to the origin.
Zeros: $(0, 0), \left(\pm\sqrt{3}, 0\right)$

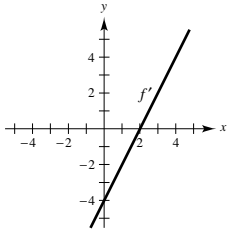


$g(x)$ is continuous on $(-\infty, \infty)$, and $f(x)$ has holes at $x = 1$ and $x = -1$.

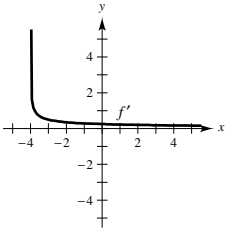
57.



59.



61.



63. $g'(0) < 0$ **65.** $g'(-6) < 0$

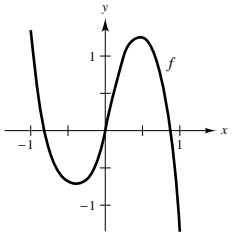
69. No. For example, the product of $f(x) = x$ and $g(x) = x$ is $f(x) \cdot g(x) = x^2$, which is decreasing on $(-\infty, 0)$ and increasing on $(0, \infty)$.

71. $(5, f(5))$ is a relative minimum.

73. (a)



(b) Critical numbers: $x \approx -0.40$ and $x \approx 0.48$

(c) Relative maximum: $(0.48, 1.25)$;
Relative minimum: $(-0.40, 0.75)$

75. (a) $s'(t) = 9.8(\sin\theta)t$; speed $= |9.8(\sin\theta)t|$

(b)

θ	0	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	$\frac{2\pi}{3}$	$\frac{3\pi}{4}$	π
$s'(t)$	0	$4.9\sqrt{2}\,t$	$4.9\sqrt{3}\,t$	$9.8t$	$4.9\sqrt{3}\,t$	$4.9\sqrt{2}\,t$	0

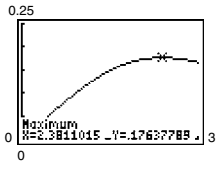
The speed is maximum at $\theta = \frac{\pi}{2}$.

77. (a)

t	0	0.5	1	1.5	2	2.5	3
$C(t)$	0	0.055	0.107	0.148	0.171	0.176	0.167

$t = 2.5$ h

(b)



$t \approx 2.38$ h (c) $t \approx 2.38$ h

79. $r = \dfrac{2R}{3}$

81. (a) $v(t) = 6 - 2t$ (b) $[0, 3)$ (c) $(3, \infty)$ (d) $t = 3$

83. (a) $v(t) = 3t^2 - 10t + 4$

(b) $\left[0, \dfrac{5 - \sqrt{13}}{3}\right)$ and $\left(\dfrac{5 + \sqrt{13}}{3}, \infty\right)$

(c) $\left(\dfrac{5 - \sqrt{13}}{3}, \dfrac{5 + \sqrt{13}}{3}\right)$ (d) $t = \dfrac{5 \pm \sqrt{13}}{3}$

85. Answers will vary.

87. (a) Minimum degree: 3

(b) $a_3(0)^3 + a_2(0)^2 + a_1(0) + a_0 = 0$
$a_3(2)^3 + a_2(2)^2 + a_1(2) + a_0 = 2$
$3a_3(0)^2 + 2a_2(0) + a_1 = 0$
$3a_3(2)^2 + 2a_2(2) + a_1 = 0$

(c) $f(x) = -\frac{1}{2}x^3 + \frac{3}{2}x^2$

89. (a) Minimum degree: 4

(b) $a_4(0)^4 + a_3(0)^3 + a_2(0)^2 + a_1(0) + a_0 = 0$
$a_4(2)^4 + a_3(2)^3 + a_2(2)^2 + a_1(2) + a_0 = 4$
$a_4(4)^4 + a_3(4)^3 + a_2(4)^2 + a_1(4) + a_0 = 0$
$4a_4(0)^3 + 3a_3(0)^2 + 2a_2(0) + a_1 = 0$
$4a_4(2)^3 + 3a_3(2)^2 + 2a_2(2) + a_1 = 0$
$4a_4(4)^3 + 3a_3(4)^2 + 2a_2(4) + a_1 = 0$

(c) $f(x) = \frac{1}{4}x^4 - 2x^3 + 4x^2$

91. False. Let $f(x) = \sin x$. **93.** False. Let $f(x) = x^3$.

95. False. Let $f(x) = x^3$. There is a critical number at $x = 0$, but not a relative extremum.

97–99. Proofs **101.** Putnam Problem A3, 2003

Section 3.4 *(page 196)*

1. Find the second derivative of a function and form test intervals by using the values for which the second derivative is zero or does not exist and the values at which the function is not continuous. Determine the sign of the second derivative on these test intervals. If the second derivative is positive, then the graph is concave upward. If the second derivative is negative, then the graph is concave downward.

3. $f' > 0$, $f'' < 0$ **5.** Concave upward: $(-\infty, \infty)$

7. Concave upward: $(-\infty, 0)$, $\left(\frac{3}{2}, \infty\right)$;
Concave downward: $\left(0, \frac{3}{2}\right)$

9. Concave upward: $(-\infty, -2)$, $(2, \infty)$;
Concave downward: $(-2, 2)$

11. Concave upward: $\left(-\infty, -\frac{1}{6}\right)$;
Concave downward: $\left(-\frac{1}{6}, \infty\right)$

13. Concave upward: $(-\infty, -1)$, $(1, \infty)$;
Concave downward: $(-1, 1)$

15. Concave upward: $\left(-\dfrac{\pi}{2}, 0\right)$; Concave downward: $\left(0, \dfrac{\pi}{2}\right)$

17. Point of inflection: $(3, 0)$; Concave downward: $(-\infty, 3)$;
Concave upward: $(3, \infty)$

19. Points of inflection: None; Concave downward: $(-\infty, \infty)$

21. Points of inflection: $(2, -16)$, $(4, 0)$;
Concave upward: $(-\infty, 2)$, $(4, \infty)$;
Concave downward: $(2, 4)$

23. Points of inflection: None; Concave upward: $(-3, \infty)$

25. Points of inflection: None; Concave upward: $(0, \infty)$

27. Point of inflection: $(2\pi, 0)$;
Concave upward: $(2\pi, 4\pi)$; Concave downward: $(0, 2\pi)$

29. Points of inflection: None; Concave upward: $(0, \pi)$, $(2\pi, 3\pi)$;
Concave downward: $(\pi, 2\pi)$, $(3\pi, 4\pi)$

31. Points of inflection: $(\pi, 0)$, $(1.823, 1.452)$, $(4.46, -1.452)$;
Concave upward: $(1.823, \pi)$, $(4.46, 2\pi)$;
Concave downward: $(0, 1.823)$, $(\pi, 4.46)$

33. Relative maximum: $(3, 9)$

35. Relative maximum: $(0, 3)$; Relative minimum: $(2, -1)$

37. Relative minimum: $(3, -25)$

39. Relative minimum: $(0, -3)$

41. Relative maximum: $(-2, -4)$; Relative minimum: $(2, 4)$

43. No relative extrema, because f is nonincreasing.

45. (a) $f'(x) = 0.2x(x - 3)^2(5x - 6)$;
$f''(x) = 0.4(x - 3)(10x^2 - 24x + 9)$

(b) Relative maximum: $(0, 0)$;
Relative minimum: $(1.2, -1.6796)$;
Points of inflection: $(0.4652, -0.7048)$, $(1.9348, -0.9048)$, $(3, 0)$

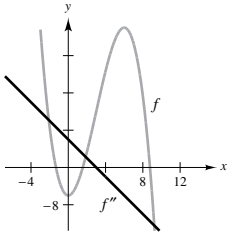
(c) 
f is increasing when f' is positive and decreasing when f' is negative. f is concave upward when f'' is positive and concave downward when f'' is negative.

47. (a) $f'(x) = \cos x - \cos 3x + \cos 5x$;
$f''(x) = -\sin x + 3 \sin 3x - 5 \sin 5x$

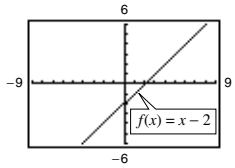
(b) Relative maximum: $\left(\frac{\pi}{2}, 1.53333\right)$;
Points of inflection: $\left(\frac{\pi}{6}, 0.2667\right)$, $(1.1731, 0.9637)$, $(1.9685, 0.9637)$, $\left(\frac{5\pi}{6}, 0.2667\right)$

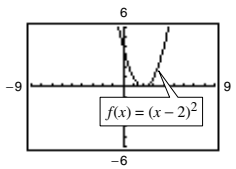
(c) 
f is increasing when f' is positive and decreasing when f' is negative. f is concave upward when f'' is positive and concave downward when f'' is negative.

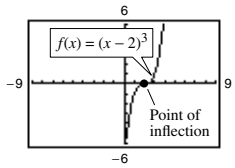
49. (a) 
(b) 
51. 
53. 
55. 
57. *Sample answer:*

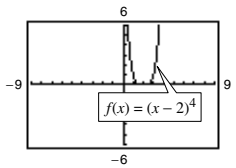


59. (a) $f(x) = (x - 2)^n$ has a point of inflection at $(2, 0)$ if n is odd and $n \geq 3$.









(b) Proof

61. $f(x) = \frac{1}{2}x^3 - 6x^2 + \frac{45}{2}x - 24$

63. (a) $f(x) = \frac{1}{32}x^3 + \frac{3}{16}x^2$ (b) Two miles from touchdown

65. $x = 100$ units

67. (a)

t	0.5	1	1.5	2	2.5	3
S	151.5	555.6	1097.6	1666.7	2193.0	2647.1

$1.5 < t < 2$

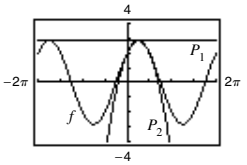
(b) 
(c) About 1.633 yr

$t \approx 1.5$

69. $P_1(x) = 2\sqrt{2}$

$P_2(x) = 2\sqrt{2} - \sqrt{2}\left(x - \frac{\pi}{4}\right)^2$

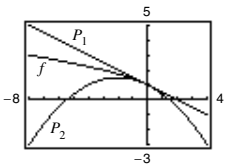
The values of f, P_1, and P_2 and their first derivatives are equal when $x = \frac{\pi}{4}$. The approximations worsen as you move away from $x = \frac{\pi}{4}$.



71. $P_1(x) = 1 - \frac{x}{2}$

$P_2(x) = 1 - \frac{x}{2} - \frac{x^2}{8}$

The values of f, P_1, and P_2 and their first derivatives are equal when $x = 0$. The approximations worsen as you move away from $x = 0$.



73. (a)–(b) Proofs **75.** True

77. False. f is concave upward at $x = c$ if $f''(c) > 0$.

79. Proof

Section 3.5 *(page 206)*

1. (a) As x increases without bound, $f(x)$ approaches -5.
(b) As x decreases without bound, $f(x)$ approaches 3.

3. 2; one from the left and one from the right

5. f **6.** c **7.** d **8.** a **9.** b **10.** e

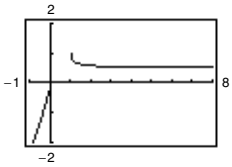
47.

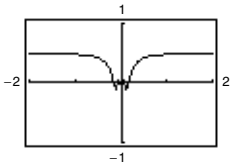
x	10^0	10^1	10^2	10^3	10^4	10^5	10^6
$f(x)$	1.000	0.513	0.501	0.500	0.500	0.500	0.500



$\lim_{x\to\infty}\left[x-\sqrt{x(x-1)}\right]=\frac{1}{2}$

49.

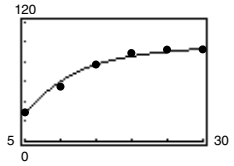
x	10^0	10^1	10^2	10^3	10^4	10^5	10^6
$f(x)$	0.479	0.500	0.500	0.500	0.500	0.500	0.500



The graph has a hole at $x = 0$.

$\lim_{x\to\infty} x\sin\frac{1}{2x}=\frac{1}{2}$

51. 100%
53. An infinite limit is a description of how a limit fails to exist. A limit at infinity deals with the end behavior of a function.
55. (a) 5 (b) -5
57. (a)



(b) Yes. $\lim_{t\to\infty} S=\frac{100}{1}=100$

59. (a) $\lim_{x\to\infty} f(x)=2$

(b) $x_1=\sqrt{\frac{4-2\varepsilon}{\varepsilon}}, x_2=-\sqrt{\frac{4-2\varepsilon}{\varepsilon}}$

(c) $M=\sqrt{\frac{4-2\varepsilon}{\varepsilon}}$ (d) $N=-\sqrt{\frac{4-2\varepsilon}{\varepsilon}}$

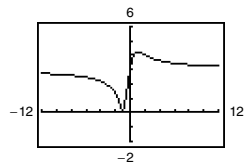
61. (a) Answers will vary. $M=\frac{5\sqrt{33}}{11}$

(b) Answers will vary. $M=\frac{29\sqrt{177}}{59}$

63–65. Proofs

67. (a) $d(m)=\frac{|3m+3|}{\sqrt{m^2+1}}$

(b)



(c) $\lim_{m\to\infty} d(m)=3$; $\lim_{m\to-\infty} d(m)=3$; As m approaches $\pm\infty$, the distance approaches 3.

69. Proof

Section 3.6 *(page 215)*

1. To analyze the graph of a function, determine the domain and range of the function, determine the intercepts, asymptotes, and symmetry of the graph, and locate the x-values for which $f'(x)$ and $f''(x)$ either are zero or do not exist. Then, use the results to determine the relative extrema and points of inflection.
3. Rational function; Use long division to rewrite the rational function as the sum of a first-degree polynomial and another rational function.
5. d **6.** c **7.** a **8.** b
9.

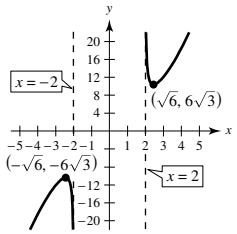
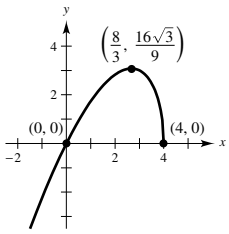
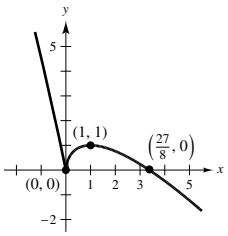
25.



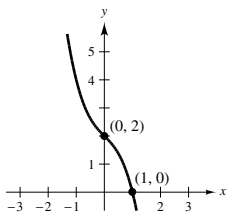
27.



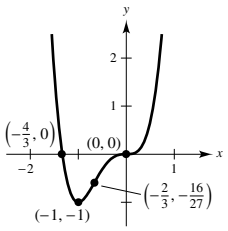
29.



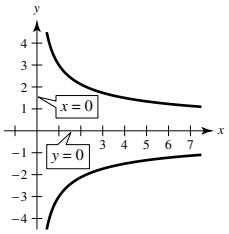
31.



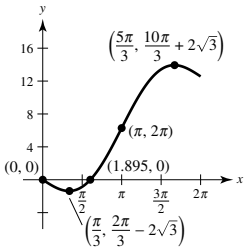
33.



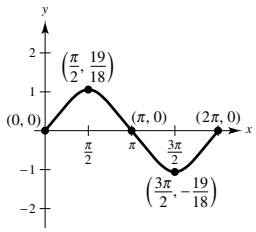
35.



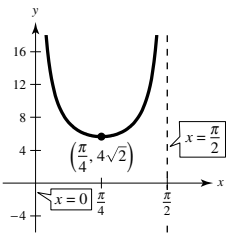
37.



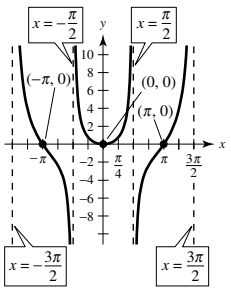
39.



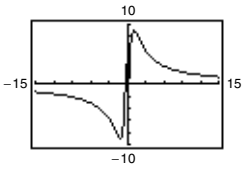
41.



43.

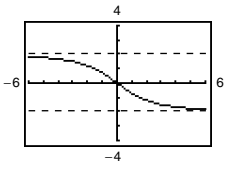


45.



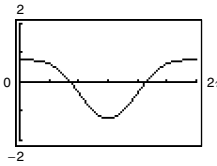
Minimum: $(-1.10, -9.05)$;
Maximum: $(1.10, 9.05)$;
Points of inflection:
$(-1.84, -7.86)$, $(1.84, 7.86)$;
Vertical asymptote: $x = 0$;
Horizontal asymptote: $y = 0$

47.



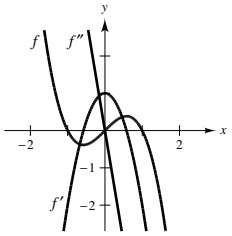
Point of inflection: $(0, 0)$;
Horizontal asymptotes: $y = \pm 2$

49.



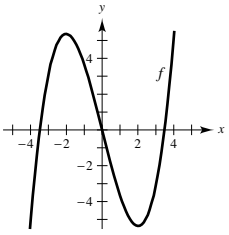
Relative minimum: $\left(\pi, -\frac{5}{4}\right)$;
Points of inflection:
$\left(\frac{2\pi}{3}, -\frac{3}{8}\right), \left(\frac{4\pi}{3}, -\frac{3}{8}\right)$

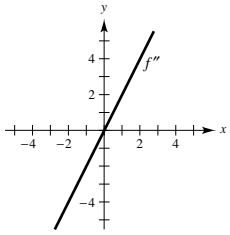
51. *Sample answer:*



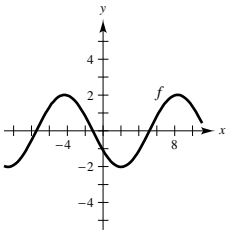
The zeros of f' correspond to the points where the graph of f has horizontal tangents. The zero of f'' corresponds to the point where the graph of f' has a horizontal tangent.

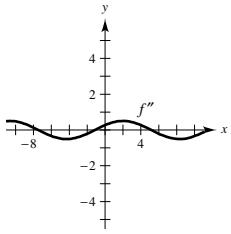
53.



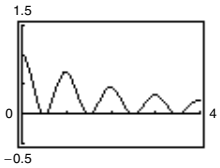


55.





57. (a)



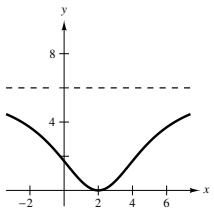
The graph has holes at $x = 0$ and at $x = 4$.
Visually approximated critical numbers: $\frac{1}{2}$, 1, $\frac{3}{2}$, 2, $\frac{5}{2}$, 3, $\frac{7}{2}$

(b) $f'(x) = \dfrac{-x\cos^2 \pi x}{(x^2 + 1)^{3/2}} - \dfrac{2\pi \sin \pi x \cos \pi x}{\sqrt{x^2 + 1}}$;

Approximate critical numbers: $\frac{1}{2}$, 0.97, $\frac{3}{2}$, 1.98, $\frac{5}{2}$, 2.98, $\frac{7}{2}$;
The critical numbers where maxima occur appear to be integers in part (a), but by approximating them using f', you can see that they are not integers.

59. Answers will vary. *Sample answer:* Let

$$f(x) = \frac{-6}{0.1(x - 2)^2 + 1} + 6.$$



61. f is decreasing on $(2, 8)$, and therefore $f(3) > f(5)$.

CHAPTER 3

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

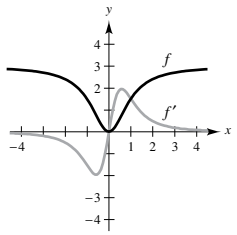
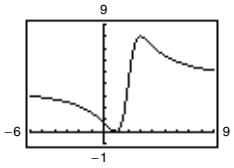
63. (a)



(b) $\lim_{x\to\infty} f(x) = 3, \quad \lim_{x\to\infty} f'(x) = 0$

(c) Because $\lim_{x\to\infty} f(x) = 3$, the graph approaches that of a horizontal line, $\lim_{x\to\infty} f'(x) = 0$.

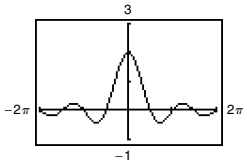
65.



The graph crosses the horizontal asymptote $y = 4$.

The graph of a function f does not cross its vertical asymptote $x = c$ because $f(c)$ does not exist.

67.

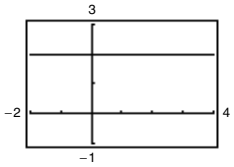


The graph has a hole at $x = 0$.

The graph crosses the horizontal asymptote $y = 0$.

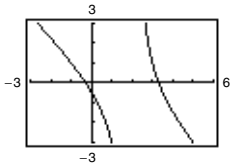
The graph of a function h does not cross its vertical asymptote $x = c$ because $h(c)$ does not exist.

69.



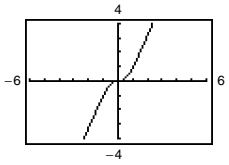
The graph has a hole at $x = 3$. The rational function is not reduced to lowest terms.

71.



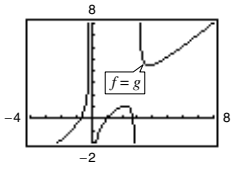
The graph appears to approach the line $y = -x + 1$, which is the slant asymptote.

73.



The graph appears to approach the line $y = 2x$, which is the slant asymptote.

75.



The graph appears to approach the line $y = x$, which is the slant asymptote.

77. (a)–(h) Proofs

79. Answers will vary. *Sample answer:* $y = \dfrac{1}{x - 3}$

81. Answers will vary.

Sample answer: $y = \dfrac{3x^2 - 7x - 5}{x - 3}$

83. False. Let $f(x) = \dfrac{2x}{\sqrt{x^2 + 2}}$, $f'(x) > 0$ for all real numbers.

85. False. For example,

$y = \dfrac{x^3 - 1}{x}$

does not have a slant asymptote.

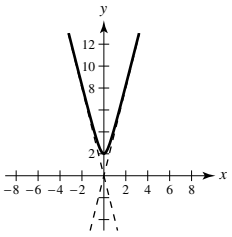
87. (a) $(-3, 1)$ (b) $(-7, -1)$

(c) Relative maximum at $x = -3$, relative minimum at $x = 1$

(d) $x = -1$

89. Answers will vary. *Sample answer:* The graph has a vertical asymptote at $x = b$. If a and b are both positive or both negative, then the graph of f approaches ∞ as x approaches b, and the graph has a minimum at $x = -b$. If a and b have opposite signs, then the graph of f approaches $-\infty$ as x approaches b, and the graph has a maximum at $x = -b$.

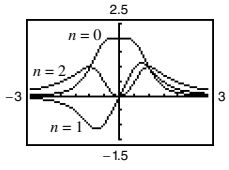
91. $y = 4x$, $y = -4x$

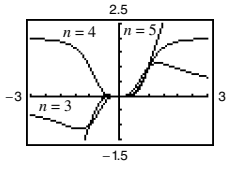


93. (a) When n is even, f is symmetric about the y-axis. When n is odd, f is symmetric about the origin.

(b) $n = 0, 1, 2, 3$ (c) $n = 4$ (d) $y = 2x$

(e)





n	0	1	2	3	4	5
M	1	2	3	2	1	0
N	2	3	4	5	2	3

Section 3.7 *(page 224)*

1. A primary equation is a formula for the quantity to be optimized. A secondary equation can be solved for a variable and then substituted into the primary equation to obtain a function of just one variable. A feasible domain is the set of input values that makes sense in an optimization problem.

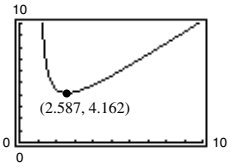
15. $\left(-\sqrt{\frac{5}{2}}, \frac{5}{2}\right), \left(\sqrt{\frac{5}{2}}, \frac{5}{2}\right)$ **17.** $(7/2, \sqrt{7/2})$

19. 40 in. $\times$ 20 in. **21.** 900 m $\times$ 450 m

23. Rectangular portion: $\frac{16}{\pi + 4} \times \frac{32}{\pi + 4}$ ft

25. (a) $L = \sqrt{x^2 + 4 + \frac{8}{x - 1} + \frac{4}{(x - 1)^2}}, \quad x > 1$

(b)

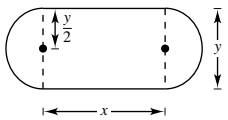


Minimum when $x \approx 2.587$

(c) (0, 0), (2, 0), (0, 4)

27. Width: $\frac{5\sqrt{2}}{2}$; Length: $5\sqrt{2}$

29. (a)



(b)

Length, x	Width, y	Area, xy
10	$(2/\pi)(100 - 10)$	$(10)(2/\pi)(100 - 10) \approx 573$
20	$(2/\pi)(100 - 20)$	$(20)(2/\pi)(100 - 20) \approx 1019$
30	$(2/\pi)(100 - 30)$	$(30)(2/\pi)(100 - 30) \approx 1337$
40	$(2/\pi)(100 - 40)$	$(40)(2/\pi)(100 - 40) \approx 1528$
50	$(2/\pi)(100 - 50)$	$(50)(2/\pi)(100 - 50) \approx 1592$
60	$(2/\pi)(100 - 60)$	$(60)(2/\pi)(100 - 60) \approx 1528$

The maximum area of the rectangle is approximately 1592 m^2.

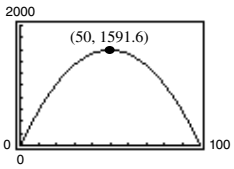
(c) $A = \frac{2}{\pi}(100x - x^2), \ 0 < x < 100$

(d) $\frac{dA}{dx} = \frac{2}{\pi}(100 - 2x)$

$= 0$ when $x = 50$;

The maximum value is approximately 1592 when $x = 50$ and $y = \frac{100}{\pi}$.

(e)



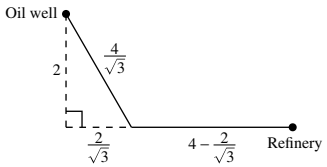
31. No. The volume changes because the shape of the container changes when it is squeezed.

33. $r = \sqrt[3]{\frac{21}{2\pi}} \approx 1.50$ ($h = 0$, so the solid is a sphere.)

35. Side of square: $\frac{10\sqrt{3}}{9 + 4\sqrt{3}}$; Side of triangle: $\frac{30}{9 + 4\sqrt{3}}$

37. $w = \frac{20\sqrt{3}}{3}$ in., $h = \frac{20\sqrt{6}}{3}$ in. **39.** $6\sqrt{3}$

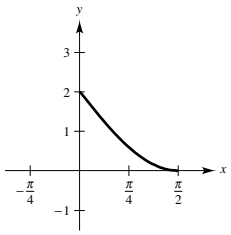
41.



The path of the pipe should go underwater from the oil well to the coast following the hypotenuse of a right triangle with leg lengths of 2 kilometers and $\frac{2}{\sqrt{3}}$ kilometers for a distance of $\frac{4}{\sqrt{3}}$ kilometers. Then the pipe should go down the coast to the refinery for a distance of $\left(4 - \frac{2}{\sqrt{3}}\right)$ kilometers.

43. One mile from the nearest point on the coast

45.



(a) Origin to y-intercept: 2;

Origin to x-intercept: $\frac{\pi}{2}$

(b) $d = \sqrt{x^2 + (2 - 2\sin x)^2}$

(c) Minimum distance is 0.9795 when $x \approx 0.7967$.

47. About 1.153 radians or 66°

49. $5.\overline{3}\%$ **51.** $y = \frac{64}{141}x$, $S \approx 6.1$ mi

53. $y = \frac{3}{10}x$, $S_3 \approx 4.50$ mi

55. (0, 0) **57.** Putnam Problem A1, 1986

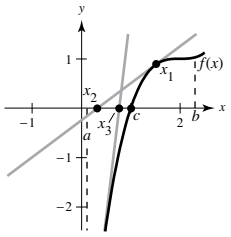
Section 3.8 *(page 233)*

1. Answers will vary. *Sample answer:* If f is a function continuous on $[a, b]$ and differentiable on (a, b), where $c \in [a, b]$ and $f(c) = 0$, then Newton's Method uses tangent lines to approximate c. First, estimate an initial x_1 close to c. (See graph.) Then determine x_2 using $x_2 = x_1 - \dfrac{f(x_1)}{f'(x_1)}$. Calculate a third estimate x_3 using $x_3 = x_2 - \dfrac{f(x_2)}{f'(x_2)}$. Continue this process until $|x_n - x_{n+1}|$ is within the desired accuracy, and let x_{n+1} be the final approximation of c.



In the answers for Exercises 3 and 5, the values in the tables have been rounded for convenience. Because a calculator and a computer program calculate internally using more digits than they display, you may produce slightly different values from those shown in the tables.

3.

n	x_n	$f(x_n)$	$f'(x_n)$	$\dfrac{f(x_n)}{f'(x_n)}$	$x_n - \dfrac{f(x_n)}{f'(x_n)}$
1	2	-1	4	-0.25	2.25
2	2.25	0.0625	4.5	0.0139	2.2361

5.

n	x_n	$f(x_n)$	$f'(x_n)$	$\dfrac{f(x_n)}{f'(x_n)}$	$x_n - \dfrac{f(x_n)}{f'(x_n)}$
1	1.6	-0.0292	-0.9996	0.0292	1.5708
2	1.5708	0	-1	0	1.5708

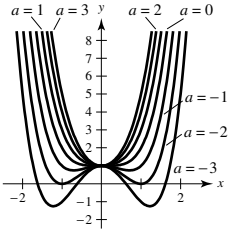
Circle dimensions: $r = 1$

Semicircle dimensions: $r = \dfrac{12}{7}$

109. $a = 6$, $b = 1$, $c = 2$

P.S. Problem Solving *(page 246)*

1. Choices of a may vary.



(a) One relative minimum at $(0, 1)$ for $a \geq 0$

(b) One relative maximum at $(0, 1)$ for $a < 0$

(c) Two relative minima for $a < 0$ when $x = \pm\sqrt{-\dfrac{a}{2}}$

(d) If $a < 0$, then there are three critical points. If $a \geq 0$, then there is only one critical point.

3. (a) No point of inflection (b) One point of inflection

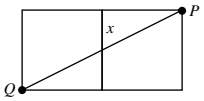
(c) $y' = ky - \dfrac{k}{L}y^2$

$y'' = ky'\left(1 - \dfrac{2}{L}y\right)$

If $y = \dfrac{L}{2}$, then $y'' = 0$, and this is a point of inflection.

5. Proof

7. The bug should head toward the midpoint of the opposite side. Without calculus, imagine opening up the cube. The shortest distance is the line PQ, passing through the midpoint as shown.



9. Proof

Chapter 4

Section 4.1 *(page 255)*

1. A function F is an antiderivative of f on an interval I when $F'(x) = f(x)$ for all x in I.

3. The particular solution results from knowing the value of $y = F(x)$ for one value of x. Using the initial condition in the general solution, you can solve for C to obtain the particular solution.

5. Proof **7.** $y = 3t^3 + C$ **9.** $y = \frac{2}{5}x^{5/2} + C$

	Original Integral	Rewrite	Integrate	Simplify

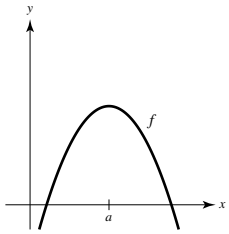
55. Answers will vary. *Sample answer:*



There is no region.

57. Geometric method:

$$\int_{-1}^{3} (x + 2)\,dx = \text{Area of large triangle} - \text{Area of small triangle}$$

$$= \frac{25}{2} - \frac{1}{2} = 12$$

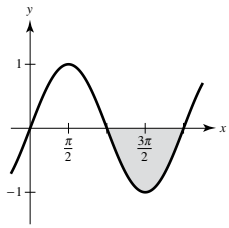
Limit definition:

$$\int_{-1}^{3} (x + 2)\,dx = \lim_{n\to\infty} \sum_{i=1}^{n} \left[\left(-1 + \frac{4i}{n} + 2\right)\left(\frac{4}{n}\right)\right] = 12$$

59. $a = -2, b = 5$

61. Answers will vary. *Sample answer:* $a = \pi, b = 2\pi$

$$\int_{\pi}^{2\pi} \sin x\,dx < 0$$



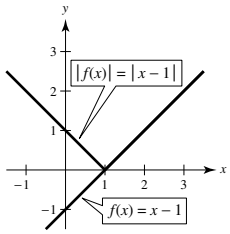
63. True **65.** True **67.** False. $\int_0^2 (-x)\,dx = -2$

69. 272 **71.** Proof

73. No. No matter how small the subintervals, the number of both rational and irrational numbers within each subinterval is infinite, and $f(c_i) = 0$ or $f(c_i) = 1$.

75. $a = -1$ and $b = 1$ maximize the integral.

77. Answers will vary. *Sample answer:*



The integrals are equal when f is always greater than or equal to 0 on $[a, b]$.

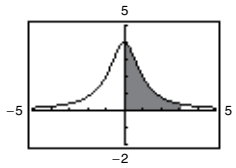
79. $\frac{1}{3}$

Section 4.4 *(page 292)*

1. Find an antiderivative of the function and evaluate the difference of the antiderivative at the upper limit of integration and the lower limit of integration.

3. The average value of a function on an interval is the integral of the function on $[a, b]$ times $\dfrac{1}{b - a}$.

5.



Positive

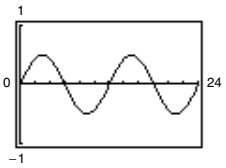
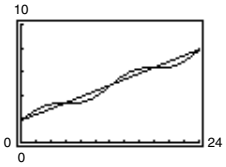
99. (a)



The area above the x-axis equals the area below the x-axis. So, the average value is zero.

(b)



So, the average value of S appears to be g.

101. The displacement and total distance traveled are equal when the particle is always moving in the same direction on an interval.

103. The Fundamental Theorem of Calculus requires that f be continuous on $[a, b]$ and that F be an antiderivative for f on the entire interval. On an interval containing c, the function $f(x) = \dfrac{1}{x - c}$ is not continuous at c.

105. 28 units

107. $f(x) = x^{-2}$ has a nonremovable discontinuity at $x = 0$.

109. $f(x) = \sec^2 x$ has a nonremovable discontinuity at $x = \dfrac{\pi}{2}$.

111. True

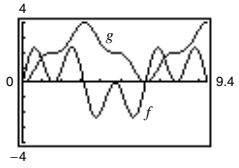
(c) 74.5 thousand units

89. (a)

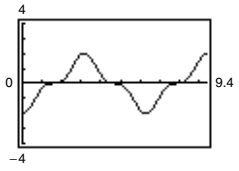


(b) g is nonnegative, because the graph of f is positive at the beginning and generally has more positive sections than negative ones.

(c) The points on g that correspond to the extrema of f are points of inflection of g.

(d) No, some zeros of f, such as $x = \dfrac{\pi}{2}$, do not correspond to extrema of g. The graph of g continues to increase after $x = \dfrac{\pi}{2}$, because f remains above the x-axis.

(e)



The graph of h is that of g shifted 2 units downward.

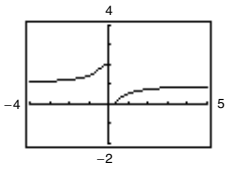
139. (a)



(b) When x increases without bound, $1/x$ approaches zero, and $e^{1/x}$ approaches 1. So, $f(x)$ approaches $2/(1 + 1) = 1$. So, $f(x)$ has a horizontal asymptote at $y = 1$. As x approaches zero from the right, $1/x$ approaches ∞, $e^{1/x}$ approaches ∞, and $f(x)$ approaches zero. As x approaches zero from the left, $1/x$ approaches $-\infty$, $e^{1/x}$ approaches zero, and $f(x)$ approaches 2. The limit does not exist because the left limit does not equal the right limit. Therefore, $x = 0$ is a nonremovable discontinuity.

141. $\displaystyle\int_0^x e^t\,dt \geq \int_0^x 1\,dt$; $e^x - 1 \geq x$; $e^x \geq x + 1$ for $x \geq 0$

143. Relative maximum: $\left(\frac{1}{k}, \frac{1}{ke}\right)$

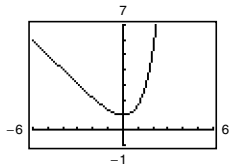
61. (a) $\infty - \infty$ (b) ∞

(c)



63. Answers will vary. *Sample answers:*

(a) $f(x) = x^2 - 25,\ g(x) = x - 5$

(b) $f(x) = (x - 5)^2,\ g(x) = x^2 - 25$

(c) $f(x) = x^2 - 25,\ g(x) = (x - 5)^3$

65. (a) Yes; $\frac{0}{0}$ (b) No; $\frac{0}{-1}$ (c) Yes; $\frac{\infty}{\infty}$ (d) Yes; $\frac{0}{0}$

(e) No; $\frac{-1}{0}$ (f) Yes; $\frac{0}{0}$

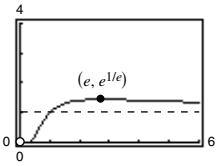
67.

x	10	10^2	10^4	10^6	10^8	10^{10}
$\frac{(\ln x)^4}{x}$	2.811	4.498	0.720	0.036	0.001	0.000

69. 0 **71.** 0 **73.** 0

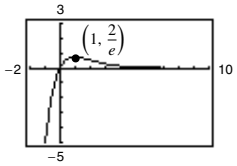
75. Horizontal asymptote: $y = 1$

Relative maximum: $(e, e^{1/e})$



77. Horizontal asymptote: $y = 0$

Relative maximum: $\left(1, \frac{2}{e}\right)$



79. Limit is not of the form $\frac{0}{0}$ or $\frac{\infty}{\infty}$.

81. Limit is not of the form $\frac{0}{0}$ or $\frac{\infty}{\infty}$.

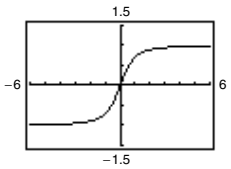
83. 1/6

85. (a) $\lim_{x\to\infty} \frac{x}{\sqrt{x^2+1}} = \lim_{x\to\infty} \frac{\sqrt{x^2+1}}{x} = \lim_{x\to\infty} \frac{x}{\sqrt{x^2+1}}$

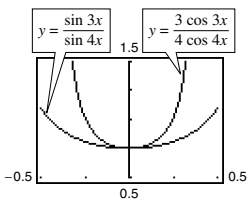
Applying L'Hôpital's Rule twice results in the original limit, so L'Hôpital's Rule fails.

(b) 1

(c)



87.



As $x \to 0$, the graphs get closer together (they both approach 0.75). By L'Hôpital's Rule,

$$\lim_{x\to 0} \frac{\sin 3x}{\sin 4x} = \lim_{x\to 0} \frac{3\cos 3x}{4\cos 4x} = \frac{3}{4}.$$

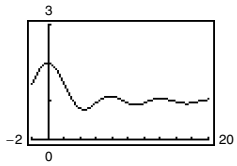
89. $\frac{Vt}{L}$ **91.** Proof **93.** $c = \frac{2}{3}$ **95.** $c = \frac{\pi}{4}$

97. False. $\frac{\infty}{0} = \pm\infty$ **99.** True **101.** True **103.** $\frac{3}{4}$

105. $c = \frac{4}{3}$ **107.** $a = 1, b = \pm 2$ **109.** Proof

111. (a) $0 \cdot \infty$ (b) 0 **113.** Proof **115.** (a)–(c) 2

117. (a)



(b) $\lim_{x\to\infty} h(x) = 1$ (c) No

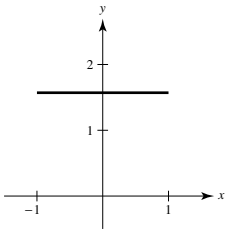
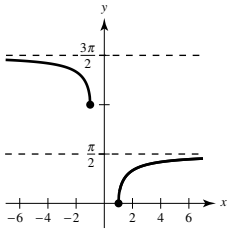
95.



(a) The graph is a horizontal line at $\dfrac{\pi}{2}$.
(b) Proof

97. $c = 2$

99. (a)



(b) Proof

Section 5.8 *(page 387)*

1. (a) No
(b) Yes. Use the rule involving the arcsecant function.

3. $\arcsin\dfrac{x}{3} + C$ **5.** $\operatorname{arcsec}|2x| + C$

7. $\arcsin(x + 1) + C$ **9.** $\frac{1}{2}\arcsin t^2 + C$

11. $\dfrac{1}{10}\arctan\dfrac{t^2}{5} + C$ **13.** $\dfrac{1}{4}\arctan\dfrac{e^{2x}}{2} + C$

15. $\arcsin\dfrac{\csc x}{5} + C$ **17.** $2\arcsin\sqrt{x} + C$

19. $\frac{1}{2}\ln(x^2 + 1) - 3\arctan x + C$

21. $8\arcsin\dfrac{x - 3}{3} - \sqrt{6x - x^2} + C$ **23.** $\dfrac{\pi}{6}$ **25.** $\dfrac{\pi}{6}$

27. $\dfrac{1}{3}\left(\arctan 3 - \dfrac{\pi}{4}\right) \approx 0.155$ **29.** $\arctan 5 - \dfrac{\pi}{4} \approx 0.588$

31. $\dfrac{\pi}{4}$ **33.** $\dfrac{1}{32}\pi^2 \approx 0.308$ **35.** $\dfrac{\pi}{2}$

37. $\ln|x^2 + 6x + 13| - 3\arctan\left(\dfrac{x + 3}{2}\right) + C$

39. $\dfrac{\sqrt{2}}{2}\arcsin\left[\dfrac{\sqrt{6}}{6}(x - 2)\right] + C$ **41.** $\arcsin\dfrac{x + 2}{2} + C$

43. $4 - 2\sqrt{3} + \dfrac{1}{6}\pi \approx 1.059$

45. $2\sqrt{e^t - 3} - 2\sqrt{3}\arctan\dfrac{\sqrt{e^t - 3}}{\sqrt{3}} + C$ **47.** $\dfrac{\pi}{6}$

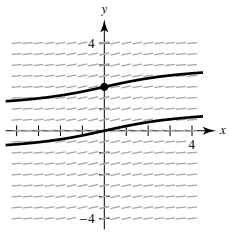
49. (a) $\arcsin x + C$ (b) $-\sqrt{1 - x^2} + C$ (c) Not possible

51. (a) $\frac{2}{3}(x - 1)^{3/2} + C$ (b) $\frac{2}{15}(x - 1)^{3/2}(3x + 2) + C$
(c) $\frac{2}{3}\sqrt{x - 1}(x + 2) + C$

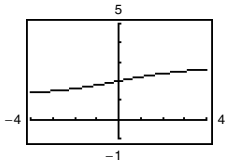
53. Proof

55. No. Graphing $f(x) = \arcsin x$ and $g(x) = -\arccos x$, you can see that the graph of f is the graph of g shifted vertically.

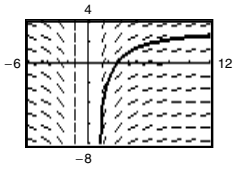
57. (a)



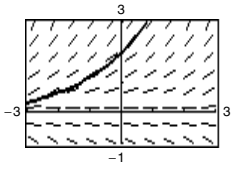
(b) $y = \dfrac{2}{3}\arctan\dfrac{x}{3} + 2$



59.

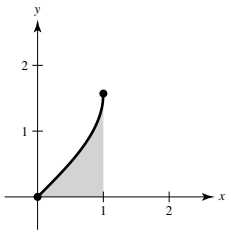


61.



63. $y = \arcsin\dfrac{x}{2} + \pi$ **65.** $\dfrac{\pi}{3}$ **67.** $\dfrac{3\pi}{2}$

69. (a)



(b) 0.5708
(c) $\dfrac{\pi - 2}{2}$

71. (a) $F(x)$ represents the average value of $f(x)$ over the interval $[x, x + 2]$; Maximum at $x = -1$
(b) Maximum at $x = -1$

73. False. $\displaystyle\int \frac{dx}{3x\sqrt{9x^2 - 16}} = \frac{1}{12}\operatorname{arcsec}\frac{|3x|}{4} + C$

75–77. Proofs

79. (a) $\displaystyle\int_0^1 \frac{1}{1 + x^2}\,dx$ (b) About 0.7857

(c) Because $\displaystyle\int_0^1 \frac{1}{1 + x^2}\,dx = \frac{\pi}{4}$, you can use the Midpoint Rule to approximate $\dfrac{\pi}{4}$. Multiplying the result by 4 gives an estimation of π.

Section 5.9 *(page 397)*

1. Hyperbolic function came from the comparison of the area of a semicircular region with the area of a region under a hyperbola.

3. $\sinh^2 x = \dfrac{-1 + \cosh 2x}{2}$ **5.** (a) 10.018 (b) -0.964

7. (a) $\frac{4}{3}$ (b) $\frac{13}{12}$ **9.** (a) 1.317 (b) 0.962

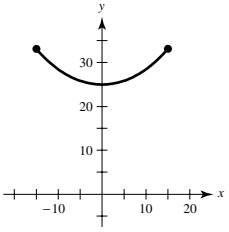
35. $y = -2x + 2$ **37.** $y = 1 - 2x$

39. Relative maximum: $(1.20, 0.66)$
Relative minimum: $(-1.20, -0.66)$

41. Relative maxima: $(\pm\pi, \cosh \pi)$
Relative minimum: $(0, -1)$

43. (a)



(b) 33.146 units, 25 units
(c) $m = \sinh 1 \approx 1.175$

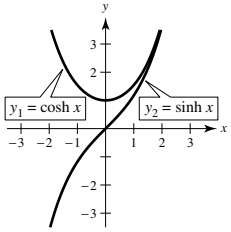
45. $\frac{1}{4}\sinh 4x + C$ **47.** $-\frac{1}{2}\cosh(1 - 2x) + C$

49. $\frac{1}{3}\cosh^3(x - 1) + C$ **51.** $\ln|\sinh x| + C$

53. $-\coth\frac{x^2}{2} + C$ **55.** $\ln\frac{5}{4}$ **57.** $\coth 1 - \coth 2$

59. $-\frac{1}{3}(\operatorname{csch} 2 - \operatorname{csch} 1)$

61.



The graphs do not intersect.

63. Proof **65.** $\frac{3}{\sqrt{9x^2 - 1}}$ **67.** $\frac{1}{2\sqrt{x}(1 - x)}$

69. $|\sec x|$ **71.** $-\csc x$ **73.** $2\sinh^{-1}(2x)$

75. $\frac{\sqrt{3}}{18}\ln\left|\frac{1 + \sqrt{3}x}{1 - \sqrt{3}x}\right| + C$ **77.** $\ln\left(\sqrt{e^{2x} + 1} - 1\right) - x + C$

79. $2\sinh^{-1}\sqrt{x} + C = 2\ln\left(\sqrt{x} + \sqrt{1 + x}\right) + C$

81. $\frac{1}{4}\ln\left|\frac{x - 4}{4}\right| + C$ **83.** $\ln\left(\frac{3 + \sqrt{5}}{2}\right)$ **85.** $\frac{\ln 7}{12}$

87. $-\frac{x^2}{2} - 4x - \frac{10}{3}\ln\left|\frac{x - 5}{x + 1}\right| + C$

89. $8\arctan e^2 - 2\pi \approx 5.207$ **91.** $\frac{5}{2}\ln\left(\sqrt{17} + 4\right) \approx 5.237$

93. (a) $-\frac{\sqrt{a^2 - x^2}}{x}$ (b) Proof

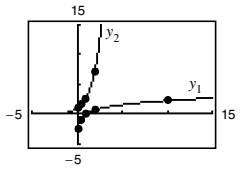
95–103. Proofs

105. (a) The identity is not correct. The correct identity is as follows: $\cosh^2 x + \sinh^2 x = \cosh(2x)$.
(b) The identity is correct.

107. Putnum Problem

Review Exercises for Chapter 5 *(page 400)*

1. $y_1(0.1) = -2.303$, $y_2(0.1) = 1.105$, $y_1(0.5) = -0.693$, $y_2(0.5) = 1.649$, $y_1(1) = 0$, $y_2(1) = 2.718$, $y_1(2) = 0.693$, $y_2(2) = 7.389$, $y_1(10) = 2.303$, $y_2(10) = 22026.47$



The graphs of $y_1 = \ln x$ and $y_2 = e^x$ are inverses of one another. This means that the domain of $\ln x$, $0 < x < \infty$, is the range of e^x and the range of $\ln x$, $-\infty < y < \infty$, is the domain of e^x. The graph of $\ln x$ has an asymptote at $x = 0$ while the graph of e^x has an asymptote at $y = 0$.

79.

x	0	0.2	0.4	0.6	0.8	1
$y(x)$ (exact)	3.0000	3.6642	4.4755	5.4664	6.6766	8.1548
$y(x)$ $(h = 0.2)$	3.0000	3.6000	4.3200	5.1840	6.2208	7.4650
$y(x)$ $(h = 0.1)$	3.0000	3.6300	4.3923	5.3147	6.4308	7.7812

81.

x	0	0.2	0.4	0.6	0.8	1
$y(x)$ (exact)	0.0000	0.2200	0.4801	0.7807	1.1231	1.5097
$y(x)$ $(h = 0.2)$	0.0000	0.2000	0.4360	0.7074	1.0140	1.3561
$y(x)$ $(h = 0.1)$	0.0000	0.2095	0.4568	0.7418	1.0649	1.4273

83. (a) $y(1) = 112.7141°$, $y(2) = 96.3770°$, $y(3) = 86.5954°$
(b) $y(1) = 113.2441°$, $y(2) = 97.0158°$, $y(3) = 87.1729°$
(c) Euler's Method: $y(1) = 112.9828°$, $y(2) = 96.6998°$, $y(3) = 86.8863°$
Exact solution: $y(1) = 113.2441°$, $y(2) = 97.0158°$, $y(3) = 87.1729°$
The approximations are better using $h = 0.05$.

85. Euler's Method produces an exact solution to an initial value problem when the exact solution is a line.

87. False. $y = x^3$ is a solution of $xy' - 3y = 0$, but $y = x^3 + 1$ is not a solution.

89. (a)

x	0	0.2	0.4	0.6	0.8	1
y	4	2.6813	1.7973	1.2048	0.8076	0.5413
y_1	4	2.56	1.6384	1.0486	0.6711	0.4295

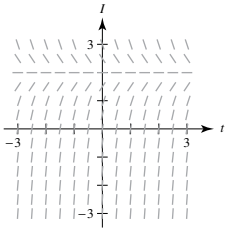
e_2	0	0.2813	0.3573	0.3408	0.2892	0.2303
r		0.4312	0.4447	0.4583	0.4720	0.4855

(b) If h is halved, then the error is approximately halved because r is approximately 0.5.
(c) The error will again be halved.

91. (a)



(b) $\lim_{t\to\infty} I(t) = 2$

93. $\omega = \pm 4$ **95.** Putnam Problem 3, morning session, 1954

Section 6.2 *(page 420)*

1. C is the initial value of y, and k is the proportionality constant.

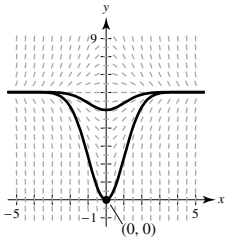
3. $y = \frac{1}{2}x^2 + 3x + C$ **5.** $y = Ce^x - 3$

7. $y^2 - 5x^2 = C$ **9.** $y = Ce^{(2x^{3/2})/3}$ **11.** $y = C(1 + x^2)$

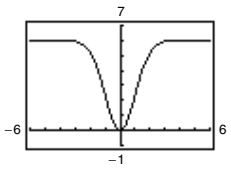
13. $\dfrac{dQ}{dt} = \dfrac{k}{t^2}$ $\quad Q = -\dfrac{k}{t} + C$

15. $\dfrac{dN}{ds} = k(500 - s)$ $\quad N = -\dfrac{k}{2}(500 - s)^2 + C$

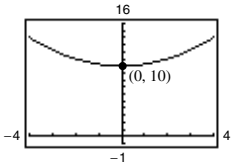
17. (a)



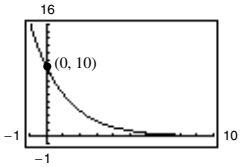
(b) $y = 6 - 6e^{-x^2/2}$



19. $y = \frac{1}{4}t^2 + 10$



21. $y = 10e^{-t/2}$



23. $\dfrac{dN}{dt} = kN$, $N = 250^e\left(\ln\left(\dfrac{8}{5}\right)t\right)$; $N = \dfrac{8192}{5}$

25. $\dfrac{dV}{dt} = kV$, $V = 20{,}000^e\left[\dfrac{1}{4}\ln\left(\dfrac{5}{8}\right)t\right]$;
$V = 3125\sqrt{10} \approx 9882.118$

27. $y = 2e^{[(1/4)\ln(3/2)]t} \approx 2e^{0.1014t}$

29. $y = 5\left(\frac{5}{2}\right)^{1/4}e^{[\ln(2/5)/4]t} \approx 6.2872e^{-0.2291t}$

31. Quadrants I and III; $\dfrac{dy}{dx}$ is positive when both x and y are positive (Quadrant I) or when both x and y are negative (Quadrant III).

33. Amount after 1000 yr: 12.96 g
Amount after 10,000 yr: 0.26 g

35. Initial quantity: 7.63 g
Amount after 1000 yr: 4.95 g

37. Amount after 1000 yr: 4.43 g
Amount after 10,000 yr: 1.49 g

39. Initial quantity: 2.16 g
Amount after 10,000 yr: 1.62 g

41. 95.76%

43. Time to double: 5.78 yr
Amount after 10 yr: $3320.12

45. Annual rate: 4.62%
Amount after 10 yr: $238.09

47. Annual rate: 7.18%
Time to double: 9.65 yr

49. $224,174.18 **51.** $61,377.75

53. (a) 10.24 yr (b) 9.93 yr (c) 9.90 yr (d) 9.90 yr

55. (a) $P = 2.098e^{-0.011t}$ (b) 1.51 million
(c) Because $k < 0$, the population is decreasing.

57. (a) $P = 6.373e^{0.012t}$ (b) 9.13 million
(c) Because $k > 0$, the population is increasing.

59. (a) $N = 100.1596(1.2455)^t$ (b) 6.3 h

61. (a) Because the population increases by a constant each month, the rate of change from month to month will always be the same. So, the slope is constant, and the model is linear.

(b) Although the percentage increase is constant each month, the rate of growth is not constant. The rate of change of y is $\frac{dy}{dt} = ry$, which is an exponential model.

63. (a) $M_1 = 2679.5e^{0.038t}$ (b) $M_2 = 235.4t + 1473$

(c) The exponential model fits the data better because the graph is closer to the data values than is the graph of the linear model.

(d) 2025 ($t \approx 45$); Yes. The exponential model indicates a reasonably slow growth rate.

65. (a) 20 dB (b) 70 dB (c) 120 dB

67. (a) $y = 1420e^{[\ln(52/71)]t} + 80 \approx 1420e^{-0.3114t} + 80$

(b) 299.2°F

69. False. It takes 1599 years.

71. (a) $I = 10^{8.3} \approx 199{,}526{,}231.5$

(b) It increases by a factor of $e^{2R \ln 10}$ or 10^R.

(c) $\frac{dR}{dI} = \frac{1}{I \ln(10)}$

Section 6.3 *(page 429)*

1. (a) Separable (b) Not separable

3. The carrying capacity is the maximum population that can be sustained over time.

5. $y^2 - x^2 = C$ **7.** $y^4 - 2x^2 + 4x = C$ **9.** $r = Ce^{(4/9)s}$

11. $y = C(x + 2)^3$ **13.** $y^3 = C - \frac{1}{3}\cos 9x$

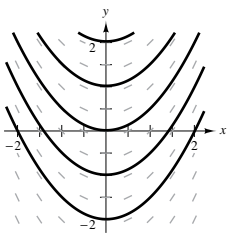
15. $y = -\frac{1}{4}\sqrt{1 - 4x^2} + C$ **17.** $y = Ce^{(\ln x)^2/2}$

19. $y^2 = 4e^x + 32$ **21.** $y = e^{-(x^2+2x)/2}$

23. $y^2 = 4x^2 + 3$ **25.** $u = e^{(5-\cos v^2)/2}$ **27.** $P = P_0e^{kt}$

29. $4y^2 - x^2 = 16$ **31.** $y = \left(\frac{x}{3}\right)^{1/5}$ **33.** $f(x) = Ce^{-x/2}$

35.



$y = \frac{1}{2}x^2 + C$

37. (a) $\frac{dy}{dx} = k(y - 4)$ (b) i (c) Proof

38. (a) $\frac{dy}{dx} = k(x - 4)$ (b) ii (c) Proof

39. (a) $\frac{dy}{dx} = ky(y - 4)$ (b) iii (c) Proof

40. (a) $\frac{dy}{dx} = ky^2$ (b) iv (c) Proof

41. (a) $y \approx 0.1602$ (b) $y = 5e^{-3x^2}$ (c) $y \approx 0.2489$; Error: $0.2489 - 0.1602 \approx 0.0887$

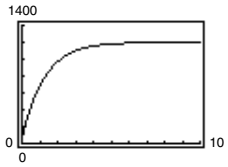
43. (a) $y \approx 3.0318$ (b) $y^3 - 4y = x^2 + 12x - 13$

(c) $y = 3$; Error: $3.0318 - 3 = 0.0318$

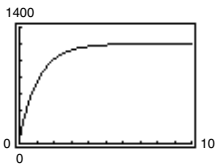
45. 97.9% of the original amount

47. (a) $w = 1200 - 1140e^{-kt}$

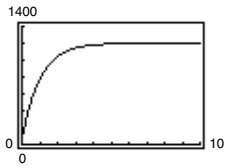
(b) $w = 1200 - 1140e^{-0.8t}$



$w = 1200 - 1140e^{-0.9t}$



$w = 1200 - 1140e^{-t}$

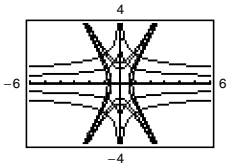


(c) 1.31 yr, 1.16 yr, 1.05 yr (d) 1200 lb

49. Hyperbolas: $3x^2 - y^2 = C$

Orthogonal trajectory: $y = \frac{K}{\sqrt[3]{x}}$

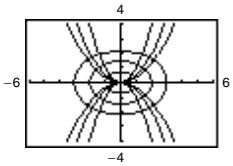
Graphs will vary.



51. Parabolas: $x^2 = Cy$

Ellipses: $x^2 + 2y^2 = K$

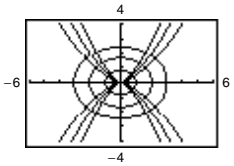
Graphs will vary.



53. Curves: $y^2 = Cx^3$

Ellipses: $2x^2 + 3y^2 = K$

Graphs will vary.



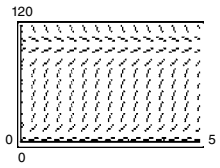
55. d **56.** a **57.** b **58.** c

59. (a) $k = 0.75$ (b) 2100 (c) 70 (d) 4.49 yr

(e) $\frac{dP}{dt} = 0.75P\left(1 - \frac{P}{2100}\right)$

61. (a) $k = 3$ (b) 100

(c)



(d) 50

63. $y = \frac{36}{1 + 8e^{-t}}$ **65.** $y = \frac{120}{1 + 14e^{-0.8t}}$

67. (a) $P = \frac{200}{1 + 7e^{-0.2640t}}$ (b) 70 panthers (c) 7.37 yr

(d) $\frac{dP}{dt} = 0.2640P\left(1 - \frac{P}{200}\right)$; 65.6; This is close to the exact answer.

(e) 7.37 years; P is increasing most rapidly where $P = 200/2 = 100$, which corresponds to $t \approx 7.37$ years.

69. Yes. Rewrite the equation as $\frac{1}{g(y) - h(y)}\,dy = f(x)\,dx$.

71. Proof

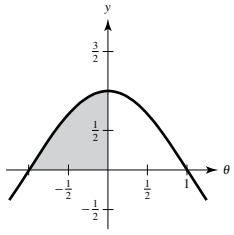
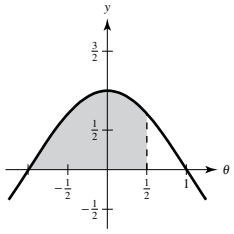
(b) $F(0) = \frac{2}{\pi} \approx 0.6366$



(c) $F\left(\frac{1}{2}\right) = \frac{\sqrt{2}+2}{\pi} \approx 1.0868$



57. 3 **59.** 16 **61.** $\int_{-2}^{1} [(2x^3 - 1) - (6x - 5)]\,dx = \frac{27}{2}$

63. $\int_0^1 \left[\frac{1}{x^2+1} - \left(-\frac{1}{2}x + 1\right)\right] dx \approx 0.0354$

65. Answers will vary.

Example: $x^4 - 2x^2 + 1 \le 1 - x^2$ on $[-1, 1]$

$\int_{-1}^{1} [(1 - x^2) - (x^4 - 2x^2 + 1)]\,dx$

67. (a) The integral $\int_0^5 [v_1(t) - v_2(t)]\,dt = 10$ means that the first car traveled 10 more meters than the second car between 0 and 5 seconds.

The integral $\int_0^{10} [v_1(t) - v_2(t)]\,dt = 30$ means that the first car traveled 30 more meters than the second car between 0 and 10 seconds.

The integral $\int_{20}^{30} [v_1(t) - v_2(t)]\,dt = -5$ means that the second car traveled 5 more meters than the first car between 20 and 30 seconds.

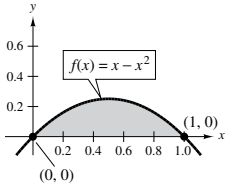
(b) No. You do not know when both cars started or the initial distance between the cars.

(c) The car with velocity v_1 is ahead by 30 meters.

(d) Car 1 is ahead by 8 meters.

69. $b = 9\left(1 - \frac{1}{\sqrt[3]{4}}\right) \approx 3.330$ **71.** $a = 4 - 2\sqrt{2} \approx 1.172$

73. Answers will vary. *Sample answer*: $\frac{1}{6}$



75. R_1; \$1.625 million

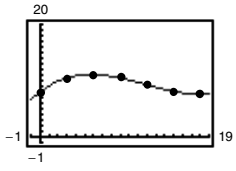
57. 20π **59.** $6\pi\left(3 - \sqrt{5}\right) \approx 14.40$

61. (a) Answers will vary. *Sample answer*: 5207.62 in.^{3}
(b) Answers will vary. *Sample answer*: 1168.64 in.^{2}
(c) $r = 0.0040y^3 - 0.142y^2 + 1.23y + 7.9$



(d) $V = 5279.64$ in.^{3}, $S = 1179.5$ in.^{2}

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

63. (a) $\pi\left(1-\frac{1}{b}\right)$ (b) $2\pi\int_1^b \frac{\sqrt{x^4+1}}{x^3}\,dx$

(c) $\lim_{b\to\infty} V = \lim_{b\to\infty} \pi\left(1-\frac{1}{b}\right) = \pi$

(d) Because $\frac{\sqrt{x^4+1}}{x^3} > \frac{\sqrt{x^4}}{x^3} = \frac{1}{x} > 0$ on $[1, b]$, you have $\int_1^b \frac{\sqrt{x^4+1}}{x^3}\,dx > \int_1^b \frac{1}{x}\,dx = \left[\ln x\right]_1^b = \ln b$ and $\lim_{b\to\infty} \ln b \to \infty$. So, $\lim_{b\to\infty} 2\pi\int_1^b \frac{\sqrt{x^4+1}}{x^3}\,dx = \infty$.

65. (a) Fleeing object: $\frac{2}{3}$ unit

Pursuer: $\frac{1}{2}\int_0^1 \frac{x+1}{\sqrt{x}}\,dx$

(b) The integral does not satisfy the definition of a definite integral because the integrand is not defined at 0.

(c) Using a graphing utility: $\frac{1}{2}\int_0^1 \frac{x+1}{\sqrt{x}}\,dx = \frac{4}{3}$

$\frac{4}{3} = 2\left(\frac{2}{3}\right)$, so the pursuer has traveled twice the distance that the fleeing object has traveled when it is caught.

67. (a) $s = 2\pi\int_0^8 x\sqrt{\frac{4}{x^{2/3}}}\,dx$

(b) The integral does not satisfy the definition of a definite integral because the integrand is not defined at 0.

(c) Using a graphing utility: $2\pi\int_0^8 x\sqrt{\frac{4}{x^{2/3}}}\,dx = \frac{384\pi}{5}$

The surface area is $\frac{384\pi}{5}$ square units.

69. Proof **71.** Proof; $g(x) = 1$

Section 7.5 *(page 491)*

1. Work is done by a force when it moves an object.

3. In Hooke's Law, F is the force required to compress or stretch a spring, d is the distance that the spring is compressed or stretched from its original length, and k is the constant of proportionality, dependent upon the specific nature of the spring.

5. 48,000 ft-lb **7.** 896 N-m

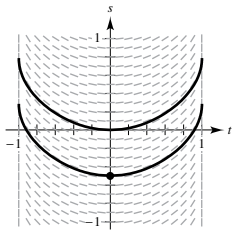
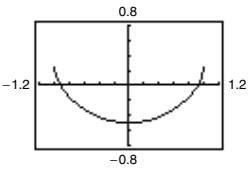
43. $\frac{6}{5}\operatorname{arcsec}\frac{|3z|}{5} + C$ **45.** $\frac{1}{4}\arctan\frac{2x + 1}{8} + C$

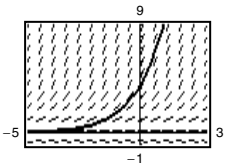
47. (a)



(b) $\frac{1}{2}\arcsin t^2 - \frac{1}{2}$



49. $y = 4e^{0.8x}$



51. $y = \frac{1}{2}e^{2x} + 10e^x + 25x + C$ **53.** $r = 10\arcsin e^t + C$

55. $y = \frac{1}{2}\arctan\frac{\tan x}{2} + C$ **57.** $\frac{1}{15}$ **59.** $\frac{1}{2}$

61. $\frac{1}{2}(1 - e^{-1}) \approx 0.316$ **63.** $\frac{3}{2}[(\ln 4)^2 - (\ln 3)^2] \approx 1.072$

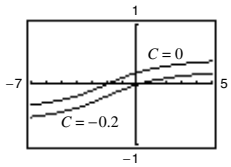
65. 8 **67.** $\ln 9 + \frac{8}{3} \approx 4.864$ **69.** $\frac{\pi}{18}$

71. $\frac{240}{\ln 3} \approx 218.457$

73. $\frac{1}{3}\arctan\left[\frac{1}{3}(x + 2)\right] + C$

Graphs will vary.

Example:

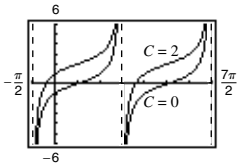


One graph is a vertical translation of the other.

75. $\tan\theta - \sec\theta + C$

Graphs will vary.

Example:



One graph is a vertical translation of the other.

77. $\frac{18\sqrt{6}}{5} \approx 8.82$ **79.** $\frac{4}{3} \approx 1.333$

81. No. When $u = x^2$, it does not follow that $x = \sqrt{u}$ because x is negative on $[-1, 0)$.

83. $a = \sqrt{2}$, $b = \frac{\pi}{4}$; $-\frac{1}{\sqrt{2}}\ln\left|\csc\left(x + \frac{\pi}{4}\right) + \cot\left(x + \frac{\pi}{4}\right)\right| + C$

85. (a) They are equivalent because

$e^{x + C_1} = e^x \cdot e^{C_1} = Ce^x$, $C = e^{C_1}$.

(b) They differ by a constant.

$\sec^2 x + C_1 = (\tan^2 x + 1) + C_1 = \tan^2 x + C$

87. a

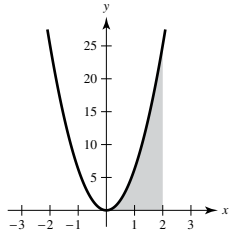
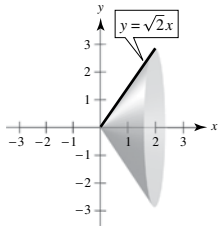
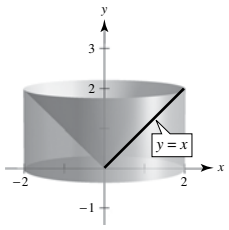
89. (a)



(b)



(c)



91. (a) $\pi(1 - e^{-1}) \approx 1.986$

(b) $b = \sqrt{\ln \dfrac{3\pi}{3\pi - 4}} \approx 0.743$

93. $\ln\left(\sqrt{2} + 1\right) \approx 0.8814$

95. $\dfrac{8\pi}{3}\left(10\sqrt{10} - 1\right) \approx 256.545$ **97.** $\dfrac{1}{3}\arctan 3 \approx 0.416$

99. About 1.0320

101. (a) $\frac{1}{3}\sin x(\cos^2 x + 2)$

(b) $\frac{1}{15}\sin x(3\cos^4 x + 4\cos^2 x + 8)$

(c) $\frac{1}{35}\sin x(5\cos^6 x + 6\cos^4 x + 8\cos^2 x + 16)$

(d) $\displaystyle\int \cos^{15} x\,dx = \int (1 - \sin^2 x)^7 \cos x\,dx$

You would expand $(1 - \sin^2 x)^7$.

103. Proof

Section 8.2 *(page 529)*

1. The formula for the derivative of a product

3. Let $dv = dx$. **5.** $u = x$, $dv = e^{9x}\,dx$

7. $u = (\ln x)^2$, $dv = dx$ **9.** $u = x$, $dv = \sec^2 x\,dx$

11. $\frac{1}{16}x^4(4\ln x - 1) + C$

13. $-\frac{1}{4}(2x + 1)\cos 4x + \frac{1}{8}\sin 4x + C$

15. $\dfrac{e^{4x}}{16}(4x - 1) + C$ **17.** $e^x(x^3 - 3x^2 + 6x - 6) + C$

19. $\frac{1}{4}[2(t^2 - 1)\ln|t + 1| - t^2 + 2t] + C$ **21.** $\frac{1}{3}(\ln x)^3 + C$

23. $\dfrac{e^{2x}}{4(2x + 1)} + C$ **25.** $\dfrac{2}{15}(x - 5)^{3/2}(3x + 10) + C$

27. $-x\cot x + \ln|\sin x| + C$

29. $(6x - x^3)\cos x + (3x^2 - 6)\sin x + C$

31. $x\arctan x - \frac{1}{2}\ln(1 + x^2) + C$

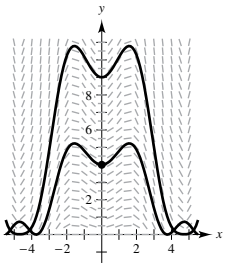
33. $-\frac{3}{34}e^{-3x}\sin 5x - \frac{5}{34}e^{-3x}\cos 5x + C$

35. $x\ln x - x + C$

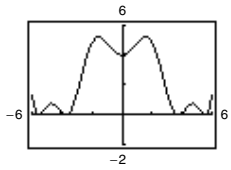
37. $y = \dfrac{2}{5}t^2\sqrt{3 + 5t} - \dfrac{8t}{75}(3 + 5t)^{3/2} + \dfrac{16}{1875}(3 + 5t)^{5/2} + C$

$= \dfrac{2}{625}\sqrt{3 + 5t}(25t^2 - 20t + 24) + C$

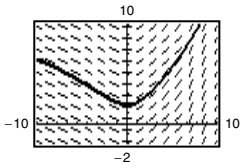
39. (a)



(b) $2\sqrt{y} - \cos x - x\sin x = 3$



41.



43. $2e^{3/2} + 4 \approx 12.963$ **45.** $\dfrac{\pi}{8} - \dfrac{1}{4} \approx 0.143$

47. $\dfrac{\pi - 3\sqrt{3} + 6}{6} \approx 0.658$

49. $\frac{1}{2}[e(\sin 1 - \cos 1) + 1] \approx 0.909$

51. $8\,\text{arcsec}\,4 + \dfrac{\sqrt{3}}{2} - \dfrac{\sqrt{15}}{2} - \dfrac{2\pi}{3} \approx 7.380$

53. $\dfrac{e^{2x}}{4}(2x^2 - 2x + 1) + C$

55. $-\cos x(x + 2)^2 + 2\sin x(x + 2) + 2\cos x + C$

57. $\frac{1}{20}(4x + 9)^{3/2}(2x + 17) + C$

59. Answers will vary. *Sample answer:* $\int x^3 \sin x\,dx$

It takes three applications until the algebraic factor becomes a constant.

61. (a) No, substitution (b) Yes, $u = \ln x$, $dv = x\,dx$

(c) Yes, $u = x^2$, $dv = e^{-3x}\,dx$ (d) No, substitution

(e) Yes, $u = x$, $dv = \dfrac{1}{\sqrt{x + 1}}\,dx$ (f) No, substitution

63. $2\left(\sin\sqrt{x} - \sqrt{x}\cos\sqrt{x}\right) + C$

65. $\frac{1}{2}\left(x^4e^{x^2} - 2x^2e^{x^2} + 2e^{x^2}\right) + C$

67. (a) and (b) $\frac{1}{3}\sqrt{4 + x^2}(x^2 - 8) + C$

69. $n = 0$: $x(\ln x - 1) + C$

$n = 1$: $\frac{1}{4}x^2(2\ln x - 1) + C$

$n = 2$: $\frac{1}{9}x^3(3\ln x - 1) + C$

$n = 3$: $\frac{1}{16}x^4(4\ln x - 1) + C$

$n = 4$: $\frac{1}{25}x^5(5\ln x - 1) + C$

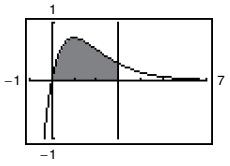
$\displaystyle\int x^n \ln x\,dx = \frac{x^{n+1}}{(n + 1)^2}[(n + 1)\ln x - 1] + C$

71–75. Proofs **77.** $-x^2\cos x + 2x\sin x + 2\cos x + C$

79. $\frac{1}{36}x^6(6\ln x - 1) + C$

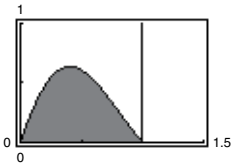
81. $\dfrac{e^{-3x}(-3\sin 4x - 4\cos 4x)}{25} + C$

83.



$2 - \dfrac{8}{e^3} \approx 1.602$

85.



$\dfrac{\pi}{1 + \pi^2}\left(\dfrac{1}{e} + 1\right) \approx 0.395$

3. *Sample answers:*
(a) If m is positive and odd, separate one factor of $\sin x$ and convert the remaining factors to $(1 - \cos^2 x)^{(m-1)/2}$, then integrate using substitution and integration by parts.
(b) If n is positive and odd, separate one factor of $\cos x$ and convert the remaining factors to $(1 - \sin^2 x)^{(n-1)/2}$ then integrate using substitution and integration by parts.
(c) If both m and n are positive and even, use integration by parts, using a Power-Reducing Formula to determine the expression for v.

5. The Trapezoidal Rule is used to approximate a definite integral by using n trapezoids. The interval $[a, b]$ is partitioned into n subintervals and each subinterval then forms a trapezoid by connecting the points where vertical lines from each subinterval endpoint meets the graph of f. The area of each trapezoid is found to approximate the definite integral.

91. False. $\displaystyle\sum_{n=1}^{\infty} ar^n = \frac{a}{1-r} - a$; The formula requires that the geometric series begins with $n = 0$.

93. True

95. Answers will vary. *Sample answer:* $\displaystyle\sum_{n=0}^{\infty} 1, \sum_{n=0}^{\infty} (-1)$

97–99. Proofs **101.** Putnam Problem A2, 1984

103. Putnam Problem B1, 2016

Section 9.3 *(page 613)*

1. f must be positive, continuous, and decreasing for $x \geq 1$ and $a_n = f(n)$.

3. Diverges **5.** Converges **7.** Converges

9. Diverges **11.** Diverges **13.** Converges

15. Converges **17.** Converges **19.** Diverges

21. Converges **23.** Diverges

25. $f(x)$ is not positive for $x \geq 1$.

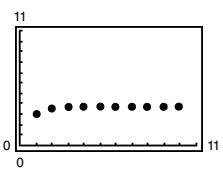
27. $f(x)$ is not always decreasing. **29.** Converges

31. Diverges **33.** Diverges **35.** Converges

37. Converges

39. (a)

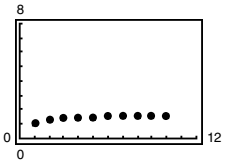
n	5	10	20	50	100
S_n	3.7488	3.75	3.75	3.75	3.75



The partial sums approach the sum 3.75 very quickly.

(b)

n	5	10	20	50	100
S_n	1.4636	1.5498	1.5962	1.6251	1.635



The partial sums approach the sum $\dfrac{\pi^2}{6} \approx 1.6449$ more slowly than the series in part (a).

41. No. Because $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n}$ diverges, $\displaystyle\sum_{n=10{,}000}^{\infty} \frac{1}{n}$ also diverges. The convergence or divergence of a series is not determined by the first finite number of terms of the series.

43. (a) 
The area under the rectangles is greater than the area under the curve. Because $\displaystyle\int_1^{\infty} \frac{1}{\sqrt{x}}\,dx = \left[2\sqrt{x}\right]_1^{\infty} = \infty$ diverges, $\displaystyle\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ diverges.

(b) 
The area under the rectangles is less than the area under the curve. Because $\displaystyle\int_1^{\infty} \frac{1}{x^2}\,dx = \left[-\frac{1}{x}\right]_1^{\infty} = 1$ converges, $\displaystyle\sum_{n=2}^{\infty} \frac{1}{n^2}$ converges $\left(\text{and so does } \displaystyle\sum_{n=1}^{\infty} \frac{1}{n^2}\right)$.

45. $p > 1$ **47.** $p > 1$ **49.** $p > 3$ **51.** Proof

53. $S_3 \approx 1.0748$ **55.** $S_8 \approx 0.9597$
$R_3 \approx 0.0123$ $R_8 \approx 0.1244$

57. $S_4 \approx 0.4049$
$R_4 \approx 5.6 \times 10^{-8}$

59. $N \geq 7$ **61.** $N \geq 16$

63. (a) $\displaystyle\sum_{n=2}^{\infty} \frac{1}{n^{1.1}}$ converges by the p-Series Test because $1.1 > 1$.
$\displaystyle\sum_{n=2}^{\infty} \frac{1}{n \ln n}$ diverges by the Integral Test because
$\displaystyle\int_2^{\infty} \frac{1}{x \ln x}\,dx$ diverges.

(b) $\displaystyle\sum_{n=2}^{\infty} \frac{1}{n^{1.1}} = 0.4665 + 0.2987 + 0.2176 + 0.1703 + 0.1393 + \cdots$
$\displaystyle\sum_{n=2}^{\infty} \frac{1}{n \ln n} = 0.7213 + 0.3034 + 0.1803 + 0.1243 + 0.0930 + \cdots$

(c) $n \geq 3.431 \times 10^{15}$

65. (a) Let $f(x) = \frac{1}{x}$. f is positive, continuous, and decreasing on $[1, \infty)$.

$S_n - 1 \le \int_1^n \frac{1}{x}\,dx = \ln n$

$S_n \ge \int_1^{n+1} \frac{1}{x}\,dx \ln(n+1)$

So, $\ln(n+1) \le S_n \le 1 + \ln n$.

(b) $\ln(n+1) - \ln n \le S_n - \ln n \le 1$

Also, $\ln(n+1) - \ln n > 0$ for $n \ge 1$. So, $0 \le S_n - \ln n \le 1$, and the sequence $\{a_n\}$ is bounded.

(c) $a_n - a_{n+1} = [S_n - \ln n] - [S_{n+1} - \ln(n+1)]$

$= \int_n^{n+1} \frac{1}{x}\,dx - \frac{1}{n+1} \ge 0$

So, $a_n \ge a_{n+1}$.

(d) Because the sequence is bounded and monotonic, it converges to a limit, γ.

(e) 0.5822

67. (a) Diverges (b) Diverges

(c) $\sum_{n=2}^{\infty} x^{\ln n}$ converges for $x < \frac{1}{e}$.

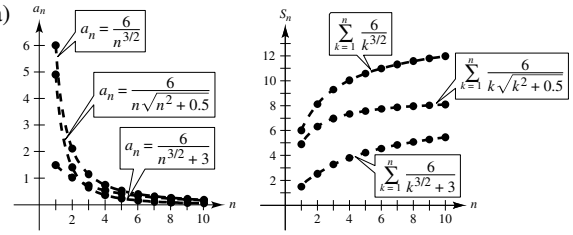
69. Diverges **71.** Converges **73.** Converges

75. Diverges **77.** Diverges **79.** Converges **81.** Proof

Section 9.4 *(page 620)*

1. Yes. The test requires that $0 \le a_n \le b_n$ for all n greater than some integer N. The beginning terms do not affect the convergence or divergence of a series.

3. (a)



(b) $\sum_{n=1}^{\infty} \frac{6}{n^{3/2}}$; Converges

(c) The magnitudes of the terms are less than the magnitudes of the terms of the p-series. Therefore, the series converges.

(d) The smaller the magnitudes of the terms, the smaller the magnitudes of the terms of the sequence of partial sums.

5. Diverges **7.** Diverges **9.** Diverges

11. Converges **13.** Converges **15.** Converges

17. Diverges **19.** Diverges **21.** Converges

23. Converges **25.** Diverges

27. Diverges; p-Series Test

29. Converges; Direct Comparison Test with $\sum_{n=1}^{\infty} \left(\frac{1}{5}\right)^n$

31. Diverges; nth-Term Test **33.** Converges; Integral Test

35. $\lim_{n\to\infty} \frac{a_n}{1/n} = \lim_{n\to\infty} na_n$; $\lim_{n\to\infty} na_n \ne 0$ but is finite.

The series diverges by the Limit Comparison Test.

37. Diverges **39.** Converges

41. $\lim_{n\to\infty} n\left(\frac{n^3}{5n^4+3}\right) = \frac{1}{5} \ne 0$

43. Diverges **45.** Converges

47. Convergence or divergence is dependent on the form of the general term for the series and not necessarily on the magnitudes of the terms.

49. (a) Proof

(b)

n	5	10	20	50	100
S_n	1.1839	1.2087	1.2212	1.2287	1.2312

(c) 0.1226 (d) 0.0277

51. Proof **53.** False. Let $a_n = \frac{1}{n^3}$ and $b_n = \frac{1}{n^2}$.

55. True **57.** True **59.** Proof **61.** $\sum_{n=1}^{\infty} \frac{1}{n^2}$, $\sum_{n=1}^{\infty} \frac{1}{n^3}$

63–69. Proofs

71. Putnam Problem 1, afternoon session, 1953

Section 9.5 *(page 629)*

1. The series diverges because of the nth-Term Test for Divergence.

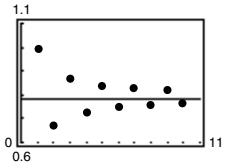
3. Σa_n is absolutely convergent if $\Sigma|a_n|$ converges. Σa_n is conditionally convergent if $\Sigma|a_n|$ diverges, but Σa_n converges.

5. (a)

n	1	2	3	4	5
S_n	1.0000	0.6667	0.8667	0.7238	0.8349

n	6	7	8	9	10
S_n	0.7440	0.8209	0.7543	0.8131	0.7605

(b)



(c) The points alternate sides of the horizontal line $y = \frac{\pi}{4}$ that represents the sum of the series. The distances between the successive points and the line decrease.

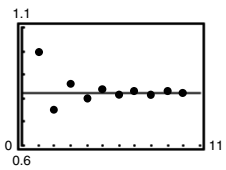
(d) The distance in part (c) is always less than the magnitude of the next term of the series.

7. (a)

n	1	2	3	4	5
S_n	1.0000	0.7500	0.8611	0.7986	0.8386

n	6	7	8	9	10
S_n	0.8108	0.8312	0.8156	0.8280	0.8180

(b)



(c) The points alternate sides of the horizontal line $y = \frac{\pi^2}{12}$ that represents the sum of the series. The distances between the successive points and the line decrease.

(d) The distance in part (c) is always less than the magnitude of the next term of the series.

9. Converges **11.** Converges **13.** Diverges
15. Diverges **17.** Converges **19.** Diverges
21. Diverges **23.** Converges **25.** Converges
27. Converges **29.** Converges **31.** $1.8264 \le S \le 1.8403$
33. $1.7938 \le S \le 1.8054$ **35.** 10 **37.** 7
39. 7 (Note that the sum begins with $n = 0$.)
41. Converges absolutely **43.** Converges absolutely
45. Converges conditionally **47.** Diverges
49. Converges conditionally **51.** Converges absolutely
53. Converges absolutely **55.** Converges conditionally
57. Converges absolutely
59. Overestimate; The next term is negative.

61. (a) False. For example, let $a_n = \dfrac{(-1)^n}{n}$.

Then $\sum a_n = \sum \dfrac{(-1)^n}{n}$ converges

and $\sum (-a_n) = \sum \dfrac{(-1)^{n+1}}{n}$ converges.

But, $\sum |a_n| = \sum \dfrac{1}{n}$ diverges.

(b) True. If $\sum |a_n|$ converged, then so would $\sum a_n$ by Theorem 9.16.

63. $p > 0$

65. Proof; The converse is false. For example: Let $a_n = \dfrac{1}{n}$.

67. (a) $\displaystyle\sum_{n=1}^{\infty} \frac{x^n}{n}$
converges absolutely (by comparison) for $-1 < x < 1$ because
$\left|\dfrac{x^n}{n}\right| < |x^n|$ and $\sum x^n$
is a convergent geometric series for $-1 < x < 1$.

(b) When $x = -1$, you have the convergent alternating series $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{n}$.
When $x = 1$, you have the divergent harmonic series $1/n$. Therefore,
$\displaystyle\sum_{n=1}^{\infty} \frac{x^n}{n}$ converges conditionally for $x = -1$.

69. (a) No; $a_{n+1} \le a_n$ is not satisfied for all n. For example, $\frac{1}{9} < \frac{1}{8}$.
(b) Yes; 0.5
71. Diverges; p-Series Test **73.** Diverges; nth-Term Test
75. Diverges; Geometric Series Test
77. Converges; Integral Test
79. Converges; Alternating Series Test
81. You cannot arbitrarily change 0 to $1 - 1$ and assume the series still converges. In fact, when regrouped with the 1 out front, the series diverges.

109. Putnam Problem 7, morning session, 1951

Section 9.7 *(page 648)*

1. The graphs of the approximating polynomial P and the elementary function f both pass through the point $(c, f(c))$, and the slope of the graph of P is the same as the slope of the graph of f at the point $(c, f(c))$. If P is of degree n, then the first n derivatives of f and P agree at c. This allows the graph of P to resemble the graph of f near the point $(c, f(c))$.
3. The accuracy is represented by the remainder of the Taylor polynomial. The remainder is $R_n(x) = \dfrac{f^{(n+1)}(z)(x-c)^{n+1}}{(n+1)!}$.
5. d **6.** c **7.** a **8.** b

53. $\sum_{n=1}^{\infty} \left(\frac{x}{3}\right)^n$; Answers will vary.

55. Answers will vary. *Sample answer:*

$\sum_{n=1}^{\infty} \frac{x^n}{n}$ converges for $-1 \le x < 1$. At $x = -1$, the convergence is conditional because $\sum \frac{1}{n}$ diverges.

$\sum_{n=1}^{\infty} \frac{x^n}{n^2}$ converges for $-1 \le x \le 1$. At $x = \pm 1$, the convergence is absolute.

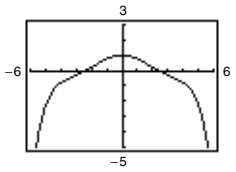
57. (a) For $f(x)$: $(-\infty, \infty)$; For $g(x)$: $(-\infty, \infty)$

(b) Proofs (c) $f(x) = \sin x$, $g(x) = \cos x$

59–63. Proofs

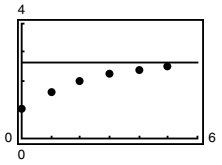
65. (a) and (b) Proofs

(c)

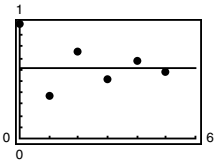


(d) 0.92

67. (a) $\frac{8}{3}$



(b) $\frac{8}{13}$

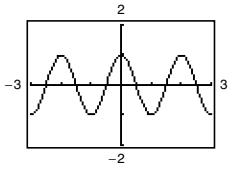


(c) The alternating series converges more rapidly. The partial sums of the series of positive terms approach the sum from below. The partial sums of the alternating series alternate sides of the horizontal line representing the sum.

(d)

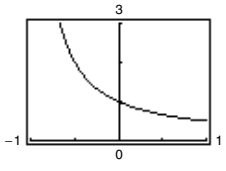
M	10	100	1000	10,000
N	5	14	24	35

69.



$f(x) = \cos \pi x$

71.



$f(x) = \frac{1}{1+x}$

73. True **75.** True

77. (a) $(-1, 1)$ (b) $f(x) = \frac{c_0 + c_1 x + c_2 x^2}{1 - x^3}$ **79.** Proof

Section 9.9 *(page 666)*

1. You need to algebraically manipulate $\frac{b}{c-x}$ so that it resembles the form $\frac{a}{1-r}$.

3. $\sum_{n=0}^{\infty} \frac{x^n}{4^{n+1}}$ **5.** $\sum_{n=0}^{\infty} \frac{4}{3}\left(\frac{-x}{3}\right)^n$

7. $\sum_{n=0}^{\infty} \left(\frac{1}{5}\right)\left(\frac{x-1}{5}\right)^n$ $(-4, 6)$ **9.** $\sum_{n=0}^{\infty} (3x)^n$ $\left(-\frac{1}{3}, \frac{1}{3}\right)$

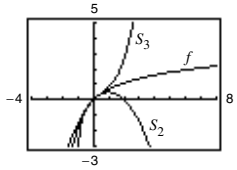
11. $-\frac{5}{9}\sum_{n=0}^{\infty}\left[\frac{2}{9}(x+3)\right]^n$ $\left(-\frac{15}{2}, \frac{3}{2}\right)$ **13.** $-2\sum_{n=0}^{\infty}[5(x+1)]^n$ $\left(-\frac{6}{5}, -\frac{4}{5}\right)$

15. $\sum_{n=0}^{\infty}\left[\frac{1}{(-3)^n} - 1\right]x^n$ $(-1, 1)$ **17.** $\sum_{n=0}^{\infty} x^n[1 + (-1)^n] = 2\sum_{n=0}^{\infty} x^{2n}$ $(-1, 1)$

19. $2\sum_{n=0}^{\infty} x^{2n}$ $(-1, 1)$ **21.** $\sum_{n=1}^{\infty} n(-1)^n x^{n-1}$ $(-1, 1)$ **23.** $\sum_{n=0}^{\infty} \frac{(-1)^n x^{n+1}}{n+1}$ $(-1, 1]$

25. $\sum_{n=0}^{\infty} (-1)^n x^{2n}$ $(-1, 1)$ **27.** $\sum_{n=0}^{\infty} (-1)^n (2x)^{2n}$ $\left(-\frac{1}{2}, \frac{1}{2}\right)$

29.



x	0.0	0.2	0.4	0.6	0.8	1.0

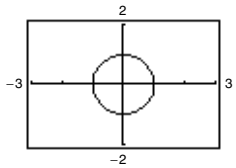
93. Proof

95. (a)



(b) Circle of radius 1 and center at $(0, 0)$ except the point $(-1, 0)$

(c) As t increases from -20 to 0, the speed increases, and as t increases from 0 to 20, the speed decreases.

97. False. $\frac{d^2y}{dx^2} = \frac{\frac{d}{dt}\left[\frac{g'(t)}{f'(t)}\right]}{f'(t)} = \frac{f'(t)g''(t) - g'(t)f''(t)}{\left[f'(t)\right]^3}$.

99. False. The resulting rectangular equation is a line.

Section 10.4 *(page 726)*

1. r is the directed distance from the origin to the point in the plane. θ is the directed angle, counterclockwise from the polar axis to the segment from the origin to the point in the plane.

3. The rectangular coordinate system is a collection of points of the form (x, y), where x is the directed distance from the y-axis to the point and y is the directed distance from the x-axis to the point. Every point has a unique representation.

The polar coordinate system is a collection of points of the form (r, θ), where r is the directed distance from the origin O to a point P and θ is the directed angle, measured counterclockwise, from the polar axis to the segment $\overline{OP}$. Polar coordinates do not have unique representations.

1. Parametric equations: $x = x_1 + at$, $y = y_1 + bt$, $z = z_1 + ct$

Symmetric equations: $\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c}$

You need a vector $\mathbf{v} = \langle a, b, c \rangle$ parallel to the line and a point $P(x_1, y_1, z_1)$ on the line.

3. $\langle 2, 4, -1 \rangle$

5. (a) Yes (b) No (c) Yes

	Parametric Equations (a)	Symmetric Equations (b)	Direction Numbers
7.	$x = 3t$ $y = t$ $z = 5t$	$\frac{x}{3} = y = \frac{z}{5}$	3, 1, 5
9.	$x = -2 + 2t$ $y = 4t$ $z = 3 - 2t$	$\frac{x+2}{2} = \frac{y}{4} = \frac{z-3}{-2}$	2, 4, −2
	Parametric Equations (a)	**Symmetric Equations (b)**	**Direction Numbers**
11.	$x = 1 + 3t$ $y = -2t$ $z = 1 + t$	$\frac{x-1}{3} = \frac{y}{-2} = \frac{z-1}{1}$	3, −2, 1
13.	$x = 5 + 17t$ $y = -3 - 11t$ $z = -2 - 9t$	$\frac{x-5}{17} = \frac{y+3}{-11} = \frac{z+2}{-9}$	17, −11, −9
15.	$x = 7 - 10t$ $y = -2 + 2t$ $z = 6$	Not possible	−10, 2, 0

17. $x = 2$, $y = 3$, $z = 4 + t$

19. $x = 2 + 3t$, $y = 3 + 2t$, $z = 4 - t$

21. $x = 5 + 2t$, $y = -3 - t$, $z = -4 + 3t$

23. $x = 2 - t$, $y = 1 + t$, $z = 2 + t$

25. $P(3, -1, -2)$, $\mathbf{v} = \langle -1, 2, 0 \rangle$

27. $P(7, -6, -2)$, $\mathbf{v} = \langle 4, 2, 1 \rangle$

29. Identical **31.** Identical **33.** (2, 3, 1), 55.5°

35. Not intersecting **37.** (a) Yes (b) Yes (c) No

39. $y - 3 = 0$ **41.** $2x + 3y - z = 10$

43. $2x - y - 2z + 6 = 0$ **45.** $3x - 19y - 2z = 0$

47. $4x - 3y + 4z = 10$ **49.** $z = 3$ **51.** $x + y + z = 5$

53. $7x + y - 11z = 5$ **55.** $y - z = -1$ **57.** $x - z = 0$

59. $9x - 3y + 2z - 21 = 0$ **61.** Parallel **63.** Identical

65. (a) $\theta \approx 65.91°$

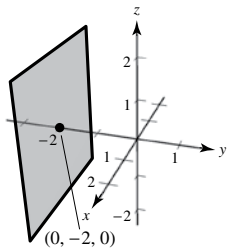
(b) $x = 2$, $y = 1 + t$, $z = 1 + 2t$

67. (a) $\theta \approx 69.67°$

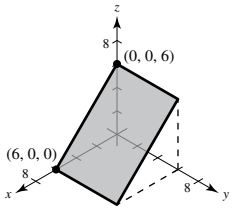
(b) $x = 2 - 9t$, $y = -1 - 5t$, $z = 22t$

69. Orthogonal **71.** Neither; 83.5° **73.** Parallel

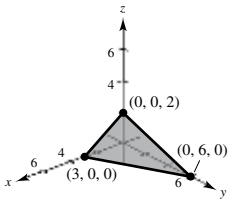
75.



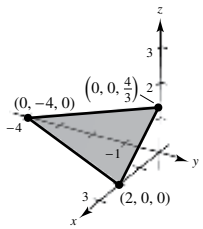
77.



79.



81.



83. The line lies in the plane. **85.** Not intersecting

87. $\frac{6\sqrt{14}}{7}$ **89.** $\frac{11\sqrt{6}}{6}$ **91.** $\frac{2\sqrt{26}}{13}$ **93.** $\frac{27\sqrt{94}}{188}$

95. $\frac{\sqrt{2533}}{17}$ **97.** $\frac{7\sqrt{3}}{3}$ **99.** $\frac{\sqrt{66}}{3}$ **101.** Exactly 1

103. Yes. Consider three points, two on one line and one on the second line. A unique plane contains all three points.

105. (a)

Year	2012	2013	2014	2015	2016	2017
z (approx.)	20.52	21.90	22.47	23.37	24.25	25.23

The approximations are close to the actual values.

(b) An increase

107. (a) $\sqrt{70}$ in.

(b) 
(c) The distance is never zero.

(d) 5 in.

Review Exercises for Chapter 11 *(page 815)*

1. A point (x, y, z) describes one position in a space and has neither magnitude nor direction. A vector (x, y, z) has a magnitude and direction but does not refer to one specific position in space.

3. (a) Solve $\cos(\theta) = \dfrac{\mathbf{u} \cdot \mathbf{v}}{\|\mathbf{u}\|\|\mathbf{v}\|}$ where θ is the angle between the vectors, and $0 \leq \theta \leq \pi$.

(b) Find the cross product of two nonparallel vectors which lie on the plane.

(c) Any set of exactly three points is contained by a plane.

(d) Use a point (x_0, y_0, z_0) on the first plane and use the coefficients a, b, c, and d from the second plane's standard equation: $ax + by + cz + d = 0$ to solve the equation: $D = \dfrac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$.

5. (a) $\langle -2, -3\rangle$ (b) $\mathbf{0}$

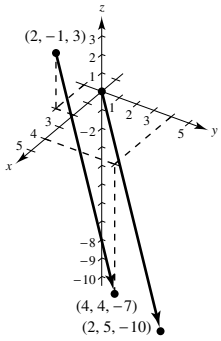
7. (a) $\mathbf{u} = \langle 3, -1\rangle, \mathbf{v} = \langle 4, 2\rangle$ (b) $\mathbf{u} = 3\mathbf{i} - \mathbf{j}, \mathbf{v} = 4\mathbf{i} + 2\mathbf{j}$
(c) $\|\mathbf{u}\| = \sqrt{10}, \|\mathbf{v}\| = 2\sqrt{5}$ (d) $\langle -5, 5\rangle$

9. $\mathbf{v} = \langle 4, 4\sqrt{3}\rangle$ **11.** $(-5, 4, 0)$ **13.** $\sqrt{22}$

15. $(x - 3)^2 + (y + 2)^2 + (z - 6)^2 = 16$

17. $(x - 2)^2 + (y - 3)^2 + z^2 = 9$
Center: $(2, 3, 0)$ Radius: 3

19. (a) and (d)



(b) $\mathbf{u} = \langle 2, 5, -10\rangle$ (c) $\mathbf{u} = 2\mathbf{i} + 5\mathbf{j} - 10\mathbf{k}$

(e) $8t^3\mathbf{i} + (12t^2 - 4t^3)\mathbf{j} + (3t^2 - 24t)\mathbf{k}$
(f) $2\mathbf{i} + 6\mathbf{j} + 8t\mathbf{k}$

37. (a) $7t^6$ (b) $12t^5\mathbf{i} - 5t^4\mathbf{j}$ **39.** $t^2\mathbf{i} + t\mathbf{j} + 9t\mathbf{k} + \mathbf{C}$

41. $\ln|t|\mathbf{i} + t\mathbf{j} - \frac{2}{5}t^{5/2}\mathbf{k} + \mathbf{C}$ **43.** $t\mathbf{i} + t^4\mathbf{j} + \frac{5^t}{\ln 5}\mathbf{k} + \mathbf{C}$

45. $e^t\mathbf{i} + t\mathbf{j} + (t\sin t + \cos t)\mathbf{k} + \mathbf{C}$

47. $4\mathbf{i} + \frac{1}{2}\mathbf{j} - \mathbf{k}$ **49.** $5\mathbf{i} + 6\mathbf{j} + \frac{\pi}{2}\mathbf{k}$

51. $2\mathbf{i} + (e^2 - 1)\mathbf{j} - (e^2 + 1)\mathbf{k}$

53. $2e^{2t}\mathbf{i} + 3(e^t - 1)\mathbf{j}$ **55.** $600\sqrt{3}t\mathbf{i} + (-16t^2 + 600t)\mathbf{j}$

57. $\frac{2 - e^{-t^2}}{2}\mathbf{i} + (e^{-t} - 2)\mathbf{j} + (t + 1)\mathbf{k}$

59. The three components of $\mathbf{u}$ are increasing functions of t at $t = t_0$.

61–67. Proofs

69. (a) 
The curve is a cycloid.

(b) The maximum of $\|\mathbf{r}'\|$ is 2, and the minimum of $\|\mathbf{r}'\|$ is 0. The maximum and the minimum of $\|\mathbf{r}'\|$ are 1.

71. Proof **73.** True

75. False. Let $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + \mathbf{k}$, then $\frac{d}{dt}\big[\|\mathbf{r}(t)\|\big] = 0$, but $\|\mathbf{r}'(t)\| = 1$.

Section 12.3 *(page 842)*

1. The direction of the velocity vector provides the direction of motion at time t, and the magnitude of the velocity vector provides the speed of the object.

3. (a) $\mathbf{v}(t) = 3\mathbf{i} + \mathbf{j}$
$\|\mathbf{v}(t)\| = \sqrt{10}$
$\mathbf{a}(t) = \mathbf{0}$
(b) $\mathbf{v}(1) = 3\mathbf{i} + \mathbf{j}$
$\mathbf{a}(1) = \mathbf{0}$
(c) 
5. (a) $\mathbf{v}(t) = 2t\,\mathbf{i} + 3t^2\mathbf{j}$
$\|\mathbf{v}(t)\| = \sqrt{4t^2 + 9t^4}$
$\mathbf{a}(t) = 2\mathbf{i} + 6t\mathbf{j}$
(b) $\mathbf{v}(1) = 2\mathbf{i} + 3\mathbf{j}$
$\mathbf{a}(1) = 2\mathbf{i} + 6\mathbf{j}$
(c) 
7. (a) $\mathbf{v}(t) = 2t\mathbf{i} + \mathbf{j}$
$\|\mathbf{v}(t)\| = \sqrt{4t^2 + 1}$
$\mathbf{a}(t) = 2\mathbf{i}$
(b) $\mathbf{v}(2) = 4\mathbf{i} + \mathbf{j}$
$\mathbf{a}(2) = 2\mathbf{i}$
(c) 
9. (a) $\mathbf{v}(t) = -2\sin t\mathbf{i} + 2\cos t\mathbf{j}$
$\|\mathbf{v}(t)\| = 2$
$\mathbf{a}(t) = -2\cos t\mathbf{i} - 2\sin t\mathbf{j}$
(b) $\mathbf{v}\left(\frac{\pi}{4}\right) = -\sqrt{2}\mathbf{i} + \sqrt{2}\mathbf{j}$
$\mathbf{a}\left(\frac{\pi}{4}\right) = -\sqrt{2}\mathbf{i} - \sqrt{2}\mathbf{j}$
(c) 
11. (a) $\mathbf{v}(t) = \langle 1 - \cos t, \sin t\rangle$
$\|\mathbf{v}(t)\| = \sqrt{2 - 2\cos t}$
$\mathbf{a}(t) = \langle \sin t, \cos t\rangle$
(b) $\mathbf{v}(\pi) = \langle 2, 0\rangle$
$\mathbf{a}(\pi) = \langle 0, -1\rangle$
(c) 
13. (a) $\mathbf{v}(t) = \mathbf{i} + 5\mathbf{j} + 3\mathbf{k}$
$\|\mathbf{v}(t)\| = \sqrt{35}$
$\mathbf{a}(t) = \mathbf{0}$
(b) $\mathbf{v}(1) = \mathbf{i} + 5\mathbf{j} + 3\mathbf{k}$
$\mathbf{a}(1) = \mathbf{0}$

15. (a) $\mathbf{v}(t) = \mathbf{i} + 2t\mathbf{j} + t\mathbf{k}$
$\|\mathbf{v}(t)\| = \sqrt{1 + 5t^2}$
$\mathbf{a}(t) = 2\mathbf{j} + \mathbf{k}$
(b) $\mathbf{v}(4) = \mathbf{i} + 8\mathbf{j} + 4\mathbf{k}$
$\mathbf{a}(4) = 2\mathbf{j} + \mathbf{k}$

17. (a) $\mathbf{v}(t) = \mathbf{i} - \mathbf{j} - \frac{t}{\sqrt{9 - t^2}}\mathbf{k}$
$\|\mathbf{v}(t)\| = \sqrt{\frac{18 - t^2}{9 - t^2}}$
$\mathbf{a}(t) = -\frac{9}{(9 - t^2)^{3/2}}\mathbf{k}$
(b) $\mathbf{v}(0) = \mathbf{i} - \mathbf{j}$
$\mathbf{a}(0) = -\frac{1}{3}\mathbf{k}$

19. (a) $\mathbf{v}(t) = 4\mathbf{i} - 3\sin t\mathbf{j} + 3\cos t\mathbf{k}$
$\|\mathbf{v}(t)\| = 5$
$\mathbf{a}(t) = -3\cos t\mathbf{j} - 3\sin t\mathbf{k}$
(b) $\mathbf{v}(\pi) = \langle 4, 0, -3\rangle$
$\mathbf{a}(\pi) = \langle 0, 3, 0\rangle$

21. (a) $\mathbf{v}(t) = (e^t \cos t - e^t \sin t)\mathbf{i} + (e^t \sin t + e^t \cos t)\mathbf{j} + e^t\mathbf{k}$
$\|\mathbf{v}(t)\| = e^t\sqrt{3}$
$\mathbf{a}(t) = -2e^t \sin t\,\mathbf{i} + 2e^t \cos t\,\mathbf{j} + e^t\mathbf{k}$
(b) $\mathbf{v}(0) = \langle 1, 1, 1\rangle$
$\mathbf{a}(0) = \langle 0, 2, 1\rangle$

23. $\mathbf{v}(t) = t(\mathbf{i} + \mathbf{j} + \mathbf{k})$
$\mathbf{r}(t) = \frac{t^2}{2}(\mathbf{i} + \mathbf{j} + \mathbf{k})$
$\mathbf{r}(2) = 2(\mathbf{i} + \mathbf{j} + \mathbf{k})$

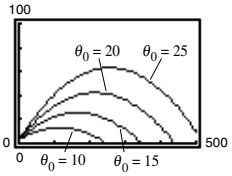
25. $\mathbf{v}(t) = \left(\frac{t^2}{2} + \frac{9}{2}\right)\mathbf{j} + \left(\frac{t^2}{2} - \frac{1}{2}\right)\mathbf{k}$
$\mathbf{r}(t) = \left(\frac{t^3}{6} + \frac{9}{2}t - \frac{14}{3}\right)\mathbf{j} + \left(\frac{t^3}{6} - \frac{1}{2}t + \frac{1}{3}\right)\mathbf{k}$
$\mathbf{r}(2) = \frac{17}{3}\mathbf{j} + \frac{2}{3}\mathbf{k}$

27. $\mathbf{v}(t) = -\sin t\,\mathbf{i} + \cos t\,\mathbf{j} + \mathbf{k}$
$\mathbf{r}(t) = \cos t\,\mathbf{i} + \sin t\,\mathbf{j} + t\mathbf{k}$
$\mathbf{r}(2) = (\cos 2)\mathbf{i} + (\sin 2)\mathbf{j} + 2\mathbf{k}$

29. 45.5 ft; The ball will clear the fence.

31. $v_0 = 40\sqrt{6}$ ft/sec; 78 ft **33.** Proof

35. (a) $\mathbf{r}(t) = \left(\frac{440}{3}\cos\theta_0\right)t\mathbf{i} + \left[3 + \left(\frac{440}{3}\sin\theta_0\right)t - 16t^2\right]\mathbf{j}$
(b)

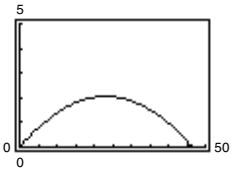


The minimum angle appears to be $\theta_0 = 20°$.
(c) $\theta_0 \approx 19.38°$

37. (a) $v_0 = 28.78$ ft/sec, $\theta = 58.28°$ (b) $v_0 \approx 32$ ft/sec

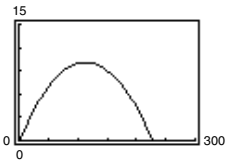
39. 1.91°

41. (a)



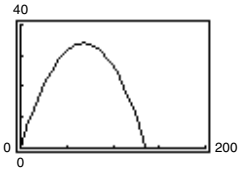
Maximum height: 2.1 ft
Range: 46.6 ft

(b)



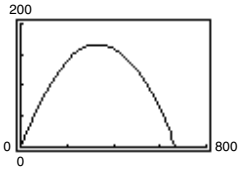
Maximum height: 10.0 ft
Range: 227.8 ft

(c)



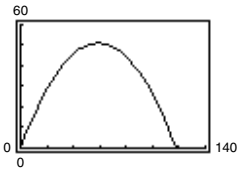
Maximum height: 34.0 ft
Range: 136.1 ft

(d)



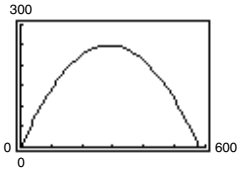
Maximum height: 166.5 ft
Range: 666.1 ft

(e)



Maximum height: 51.0 ft
Range: 117.9 ft

(f)



Maximum height: 249.8 ft
Range: 576.9 ft

43. Maximum height: 129.1 m; Range: 886.3 m **45.** Proof

47. $\mathbf{v}(t) = b\omega[(1 - \cos\omega t)\mathbf{i} + \sin\omega t\mathbf{j}]$
$\mathbf{a}(t) = b\omega^2(\sin\omega t\mathbf{i} + \cos\omega t\mathbf{j})$
(a) $\|\mathbf{v}(t)\| = 0$ when $\omega t = 0, 2\pi, 4\pi, \ldots$
(b) $\|\mathbf{v}(t)\|$ is maximum when $\omega t = \pi, 3\pi, \ldots$

49. $\mathbf{v}(t) = -b\omega \sin\omega t\mathbf{i} + b\omega\cos\omega t\mathbf{j}$
$\mathbf{v}(t) \cdot \mathbf{r}(t) = 0$

51. $\mathbf{a}(t) = -b\omega^2(\cos\omega t\mathbf{i} + \sin\omega t\mathbf{j}) = -\omega^2\mathbf{r}(t)$; $\mathbf{a}(t)$ is a negative multiple of a unit vector from (0, 0) to $(\cos\omega t, \sin\omega t)$, so $\mathbf{a}(t)$ is directed toward the origin.

53. $8\sqrt{2}$ ft/sec

55. The velocity of an object involves both magnitude and direction of motion, whereas speed involves only magnitude.

57. This is true for uniform circular motion but not true for non-uniform circular motion.

59–61. Proofs **63.** True

65. False. Consider $\mathbf{r}(t) = \langle t^2, -t^2\rangle$. Then $\mathbf{v}(t) = \langle 2t, -2t\rangle$ and $\|\mathbf{v}(t)\| = \sqrt{8t^2}$.

Section 12.4 *(page 852)*

1. The unit tangent vector points in the direction of motion.

3. $\mathbf{T}(1) = \frac{\sqrt{2}}{2}(\mathbf{i} + \mathbf{j})$ **5.** $\mathbf{T}\left(\frac{\pi}{3}\right) = -\frac{\sqrt{3}}{2}\mathbf{i} + \frac{1}{2}\mathbf{j}$

7. $\mathbf{T}(e) = \frac{3e\mathbf{i} - \mathbf{j}}{\sqrt{9e^2 + 1}} \approx 0.9926\mathbf{i} - 0.1217\mathbf{j}$

9. $\mathbf{T}(0) = \frac{\sqrt{2}}{2}(\mathbf{i} + \mathbf{k})$
$x = t$
$y = 0$
$z = t$

11. $\mathbf{T}(0) = \frac{\sqrt{2}}{2}(\mathbf{j} + \mathbf{k})$
$x = 1$
$y = 3t$
$z = -4 + 3t$

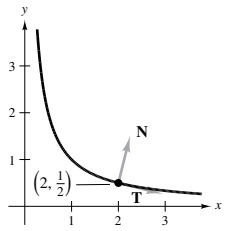
13. $\mathbf{T}\left(\frac{\pi}{4}\right) = \frac{1}{2}\langle -\sqrt{2}, \sqrt{2}, 0\rangle$
$x = \sqrt{2} - \sqrt{2}t$
$y = \sqrt{2} + \sqrt{2}t$
$z = 4$

15. $\mathbf{N}(2) = \frac{\sqrt{5}}{5}(-2\mathbf{i} + \mathbf{j})$

17. $\mathbf{N}(1) = -\frac{\sqrt{14}}{14}(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k})$

19. $\mathbf{N}\left(\frac{3\pi}{4}\right) = \frac{\sqrt{2}}{2}(\mathbf{i} - \mathbf{j})$

21. $\mathbf{r}(2) = 2\mathbf{i} + \frac{1}{2}\mathbf{j}$
$\mathbf{T}(2) = \frac{\sqrt{17}}{17}(4\mathbf{i} - \mathbf{j})$
$\mathbf{N}(2) = \frac{\sqrt{17}}{17}(\mathbf{i} + 4\mathbf{j})$



23. $\mathbf{r}(2) = 5\mathbf{i} - 4\mathbf{j}$
$\mathbf{T}(2) = \frac{\mathbf{i} - 2\mathbf{j}}{\sqrt{5}}$
$\mathbf{N}(2) = \frac{-2\mathbf{i} - \mathbf{j}}{\sqrt{5}}$,
perpendicular to $\mathbf{T}(2)$

25. $a_{\mathbf{T}} = -\sqrt{2}$ $a_{\mathbf{N}} = \sqrt{2}$ **27.** $a_{\mathbf{T}} = -\frac{7\sqrt{5}}{5}$ $a_{\mathbf{N}} = \frac{6\sqrt{5}}{5}$ **29.** $a_{\mathbf{T}} = \sqrt{2}e^{\pi/2}$ $a_{\mathbf{N}} = \sqrt{2}e^{\pi/2}$

31. $\mathbf{T}(t) = -\sin \omega t\mathbf{i} + \cos \omega t\mathbf{j}$
$\mathbf{N}(t) = -\cos \omega t\mathbf{i} - \sin \omega t\mathbf{j}$
$a_{\mathbf{T}} = 0$
$a_{\mathbf{N}} = a\omega^2$

33. $\|\mathbf{v}(t)\| = a\omega$; The speed is constant because $a_{\mathbf{T}} = 0$.

35. $a_{\mathbf{T}}$ is undefined. $a_{\mathbf{N}}$ is undefined. **37.** $a_{\mathbf{T}} = \frac{5\sqrt{6}}{6}$ $a_{\mathbf{N}} = \frac{\sqrt{30}}{6}$

39. $a_{\mathbf{T}} = \sqrt{3}$
$a_{\mathbf{N}} = \sqrt{2}$

41. The particle's motion is in a straight line.

43. $\mathbf{v}(t) = \mathbf{r}'(t) = 3\mathbf{i} + 4\mathbf{j}$
$\|\mathbf{v}(t)\| = \sqrt{9 + 16} = 5$
$\mathbf{a}(t) = \mathbf{v}'(t) = \mathbf{0}$
$\mathbf{T}(t) = \frac{\mathbf{v}(t)}{\|\mathbf{v}(t)\|} = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}$
$\mathbf{T}'(t) = 0 \implies \mathbf{N}(t)$ does not exist.
The path is a line. The speed is constant (5).

45. (a) $t = \frac{1}{2}$: $a_{\mathbf{T}} = \frac{\sqrt{2}\pi^2}{2}$, $a_{\mathbf{N}} = \frac{\sqrt{2}\pi^2}{2}$
$t = 1$: $a_{\mathbf{T}} = 0$, $a_{\mathbf{N}} = \pi^2$
$t = \frac{3}{2}$: $a_{\mathbf{T}} = -\frac{\sqrt{2}\pi^2}{2}$, $a_{\mathbf{N}} = \frac{\sqrt{2}\pi^2}{2}$
(b) $t = \frac{1}{2}$: Increasing because $a_{\mathbf{T}} > 0$.
$t = 1$: Maximum because $a_{\mathbf{T}} = 0$.
$t = \frac{3}{2}$: Decreasing because $a_{\mathbf{T}} < 0$.

47. $\mathbf{T}\left(\frac{\pi}{2}\right) = \frac{\sqrt{17}}{17}(-4\mathbf{i} + \mathbf{k})$
$\mathbf{N}\left(\frac{\pi}{2}\right) = -\mathbf{j}$
$\mathbf{B}\left(\frac{\pi}{2}\right) = \frac{\sqrt{17}}{17}(\mathbf{i} + 4\mathbf{k})$

49. $\mathbf{T}\left(\frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}(\mathbf{j} - \mathbf{k})$
$\mathbf{N}\left(\frac{\pi}{4}\right) = -\frac{\sqrt{2}}{2}(\mathbf{j} + \mathbf{k})$
$\mathbf{B}\left(\frac{\pi}{4}\right) = -\mathbf{i}$

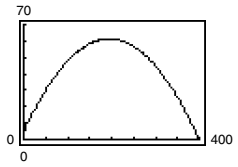
51. $\mathbf{T}\left(\frac{\pi}{3}\right) = \frac{\sqrt{5}}{5}\left(\mathbf{i} - \sqrt{3}\mathbf{j} + \mathbf{k}\right)$
$\mathbf{N}\left(\frac{\pi}{3}\right) = -\frac{1}{2}\left(\sqrt{3}\mathbf{i} + \mathbf{j}\right)$
$\mathbf{B}\left(\frac{\pi}{3}\right) = \frac{\sqrt{5}}{10}\left(\mathbf{i} - \sqrt{3}\mathbf{j} - 4\mathbf{k}\right)$

53. $\mathbf{N}(t) = \frac{1}{\sqrt{16t^2 + 9}}(-4t\mathbf{i} + 3\mathbf{j})$

55. $\mathbf{N}(t) = \frac{1}{\sqrt{5t^2 + 25}}(-t\mathbf{i} - 2t\mathbf{j} + 5\mathbf{k})$

57. $a_{\mathbf{T}} = \frac{-32(v_0 \sin \theta - 32t)}{\sqrt{v_0^2 \cos^2 \theta + (v_0 \sin \theta - 32t)^2}}$
$a_{\mathbf{N}} = \frac{32v_0 \cos \theta}{\sqrt{v_0^2 \cos^2 \theta + (v_0 \sin \theta - 32t)^2}}$
At maximum height, $a_{\mathbf{T}} = 0$ and $a_{\mathbf{N}} = 32$.

59. (a) $\mathbf{r}(t) = 60\sqrt{3}t\mathbf{i} + (5 + 60t - 16t^2)\mathbf{j}$
(b)

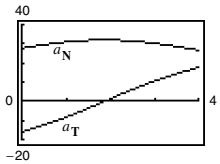


Maximum height $\approx$ 61.245 ft
Range $\approx$ 398.186 ft
(c) $\mathbf{v}(t) = 60\sqrt{3}\mathbf{i} + (60 - 32t)\mathbf{j}$
$\|\mathbf{v}(t)\| = 8\sqrt{16t^2 - 60t + 225}$
$\mathbf{a}(t) = -32\mathbf{j}$
(d)

t	0.5	1.0	1.5
Speed	112.85	107.63	104.61

t	2.0	2.5	3.0
Speed	104	105.83	109.98

(e)



The speed is decreasing when $a_{\mathbf{T}}$ and $a_{\mathbf{N}}$ have opposite signs.

61. (a) $4\sqrt{625\pi^2 + 1} \approx 314$ mi/h
(b) $a_{\mathbf{T}} = 0$, $a_{\mathbf{N}} = 1000\pi^2$
$a_{\mathbf{T}} = 0$ because the speed is constant.

63. (a) The centripetal component is quadrupled.
(b) The centripetal component is halved.

65. 4.74 mi/sec **67.** 4.67 mi/sec

69. False. These vectors are perpendicular for an object traveling at a constant speed but not for an object traveling at a variable speed.

71. (a) and (b) Proofs **73–75.** Proofs

Section 12.5 *(page 864)*

Review Exercises for Chapter 12 *(page 867)*

1. The domain of a vector-valued function is the intersection of the domains of the component functions and is a set of real numbers. The range of a vector-valued function is a set of vectors.

3. Even though the speed is constant, the velocity vector might be changing direction, making the acceleration nonzero. For example, consider $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$.

5. (a) $\left(x - \dfrac{\pi}{2}\right)^2 + y^2 = 1$

(b) Because the curvature is not as great, the radius of the curvature is greater.

7. (a) All reals except $\dfrac{\pi}{2} + n\pi$, n is an integer.

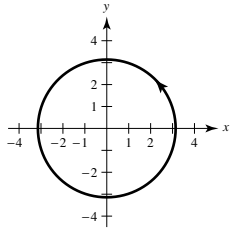
(b) Continuous except at $t = \dfrac{\pi}{2} + n\pi$, n is an integer.

9. (a) $[3, \infty)$ (b) Continuous for all $t \geq 3$

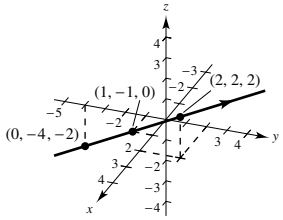
11. (a) $\mathbf{i} - \sqrt{2}\mathbf{k}$ (b) $-3\mathbf{i} + 4\mathbf{j}$
(c) $(2c - 1)\mathbf{i} + (c - 1)^2\mathbf{j} - \sqrt{c + 1}\mathbf{k}$
(d) $2\Delta t\mathbf{i} + \Delta t(\Delta t + 2)\mathbf{j} - \left(\sqrt{\Delta t + 3} - \sqrt{3}\right)\mathbf{k}$

13. $\mathbf{r}(t) = (3 - t)\mathbf{i} - 2t\mathbf{j} + (5 - 2t)\mathbf{k}, \quad 0 \leq t \leq 1$
$x = 3 - t, y = -2t, z = 5 - 2t, \quad 0 \leq t \leq 1$

15.



17.



19. $\mathbf{r}(t) = t\mathbf{i} + \left(-\frac{3}{4}t + 3\right)\mathbf{j}$

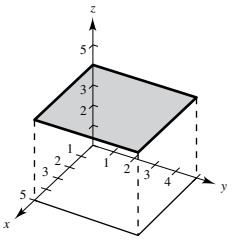
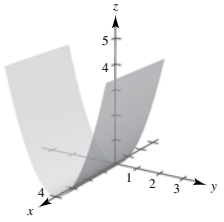
31. Domain: $\{(x, y): y < -x + 5\}$
Range: all real numbers

33. (a) (20, 0, 0) (b) (−15, 10, 20)
(c) (20, 15, 25) (d) (20, 20, 0)

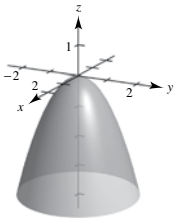
35. Plane



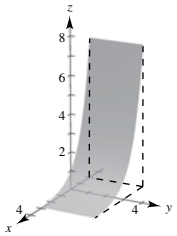
37. Cylinder with rulings parallel to the x-axis



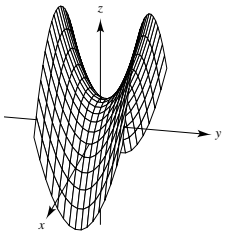
39. Paraboloid



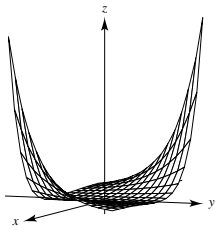
41. Cylinder with rulings parallel to the y-axis



43.

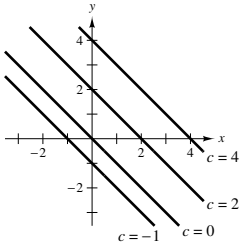


45.

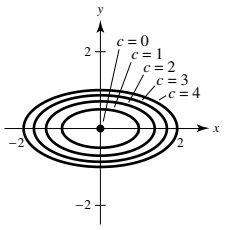


47. c **48.** d **49.** b **50.** a

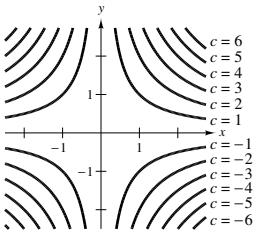
51. Lines: $x + y = c$



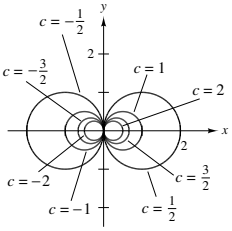
53. Ellipses: $x^2 + 4y^2 = c$ [except $x^2 + 4y^2 = 0$ is the point (0, 0)]



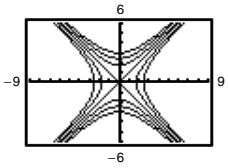
55. Hyperbolas: $xy = c$



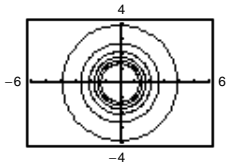
57. Circles passing through (0, 0)
Centered at $\left(\frac{1}{2c}, 0\right)$



59.



61.



63. Yes; The definition of a function of two variables requires that z be unique for each ordered pair (x, y) in the domain.

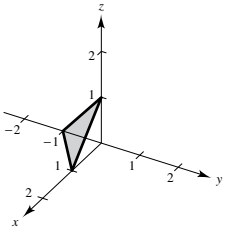
65. $f(x, y) = \frac{x}{y}$ $\left(\text{The level curves are the lines } y = \frac{x}{c}.\right)$

67. The surface may be shaped like a saddle. For example, let $f(x, y) = xy$. The graph is not unique because any vertical translation will produce the same level curves.

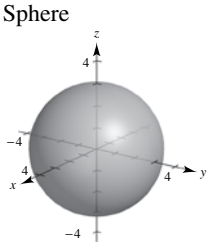
69.

	Inflation Rate		
Tax Rate	0	0.03	0.05
0	\$1790.85	\$1332.56	\$1099.43
0.28	\$1526.43	\$1135.80	\$937.09
0.35	\$1466.07	\$1090.90	\$900.04

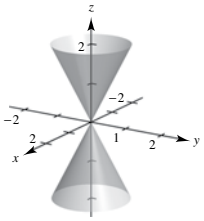
71. Plane



73. Sphere

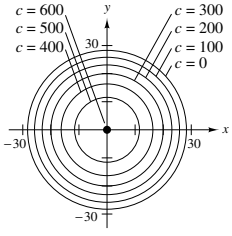


75. Elliptic cone



77. (a) 243 board-ft (b) 507 board-ft

79.



81. 36,661 units

83. Proof

85. (a) $k = \frac{520}{3}$

(b) $P = \frac{520T}{3V}$

The level curves are lines.

87. (a) C (b) A (c) B

89. $C = 4.50xy + 5.00(xz + yz)$

91. False. Let $f(x, y) = 4$.

93. False. The equation of a sphere is not a function.

95. Putnam Problem A1, 2008

127. (a) $\frac{\partial z}{\partial x} = 0.54, \frac{\partial z}{\partial y} = -0.6$

(b) As the expenditures on amusement parks and campgrounds increase, the expenditures on spectator sports increase. As the expenditures on live entertainment increase, the expenditures on spectator sports decrease.

129. (a) $f_x(x, y) = \frac{y(x^4 + 4x^2y^2 - y^4)}{(x^2 + y^2)^2}$

$f_y(x, y) = \frac{x(x^4 - 4x^2y^2 - y^4)}{(x^2 + y^2)^2}$

(b) $f_x(0, 0) = 0, f_y(0, 0) = 0$

(c) $f_{xy}(0, 0) = -1, f_{yx}(0, 0) = 1$

(d) f_{xy} or f_{yx} or both are not continuous at $(0, 0)$.

131. Proof

Section 13.4 *(page 909)*

1. In general, the accuracy worsens as Δx and Δy increase.

3. $dz = 15x^2y^2\,dx + 10x^3y\,dy$

5. $dz = (e^{x^2+y^2} + e^{-x^2-y^2})(x\,dx + y\,dy)$

7. $dw = 2xyz^2\,dx + (x^2z^2 + z\cos yz)\,dy + (2x^2yz + y\cos yz)$

9. (a) $f(2, 1) = 1, f(2.1, 1.05) = 1.05, \Delta z = 0.05$

(b) $dz = 0.05$

11. (a) $f(2, 1) = 11, f(2.1, 1.05) = 10.4875, \Delta z = -0.5125$

(b) $dz = -0.5$

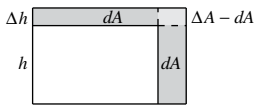
13. (a) $f(2, 1) = e^2 \approx 7.3891, f(2.1, 1.05) = 1.05e^{2.1} \approx 8.5745, \Delta z \approx 1.1854$

(b) $dz \approx 1.1084$

15. 0.44 **17.** 0

19. Yes. Because f_x and f_y are continuous on R, you know that f is differentiable on R. Because f is differentiable on R, you know that f is continuous on R.

21. $dA = h\,dl + l\,dh$



$\Delta A - dA = dl\,dh$

23. $dV = \pm 3.92$ in.^{3}, $\frac{dV}{V} = 0.82\%$

25.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

21. (a) $x - 2y + 2z = 7$ (b) $x - 1 = \dfrac{y+1}{-2} = \dfrac{z-2}{2}$

23. (a) $6x - 4y - z = 5$ (b) $\dfrac{x-3}{6} = \dfrac{y-2}{-4} = \dfrac{z-5}{-1}$

25. (a) $10x + 5y + 2z = 30$ (b) $\dfrac{x-1}{10} = \dfrac{y-2}{5} = \dfrac{z-5}{2}$

27. (a) $8x + y - z = 0$ (b) $\dfrac{x}{8} = \dfrac{y-2}{1} = \dfrac{z-2}{-1}$

29. $x = t + 1, y = 1 - t, z = t + 1$

31. $x = 4t + 3, y = 4t + 3, z = 4 - 3t$

33. $x = t + 3, y = 5t + 1, z = 2 - 4t$

35. 86.0° **37.** 77.4° **39.** (0, 3, 12) **41.** (2, 2, −4)

43. (0, 0, 0) **45.** Proof **47.** (a) and (b) Proofs

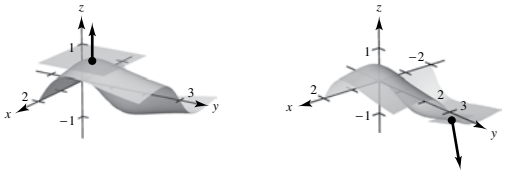
49. Not necessarily; They only need to be parallel.

51. $\left(-\frac{1}{2}, \frac{1}{4}, \frac{1}{4}\right)$ or $\left(\frac{1}{2}, -\frac{1}{4}, -\frac{1}{4}\right)$ **53.** $(-2, 1, -1)$ or $(2, -1, 1)$

55. (a) Line: $x = 1, y = 1, z = 1 - t$
Plane: $z = 1$

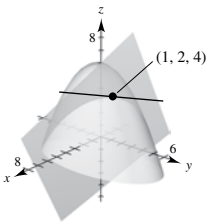
(b) Line: $x = -1, y = 2 + \frac{6}{25}t, z = -\frac{4}{5} - t$
Plane: $6y - 25z - 32 = 0$

(c)



57. (a) $x = 1 + t$
$y = 2 - 2t$
$z = 4$
$\theta \approx 48.2°$

(b)



59. $F(x, y, z) = \dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} + \dfrac{z^2}{c^2} - 1$

$F_x(x, y, z) = \dfrac{2x}{a^2}$

$F_y(x, y, z) = \dfrac{2y}{b^2}$

$F_z(x, y, z) = \dfrac{2z}{c^2}$

Plane: $\dfrac{2x_0}{a^2}(x - x_0) + \dfrac{2y_0}{b^2}(y - y_0) + \dfrac{2z_0}{c^2}(z - z_0) = 0$

$\dfrac{x_0 x}{a^2} + \dfrac{y_0 y}{b^2} + \dfrac{z_0 z}{c^2} = 1$

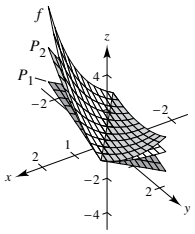
61. $F(x, y, z) = a^2x^2 + b^2y^2 - z^2$
$F_x(x, y, z) = 2a^2x$
$F_y(x, y, z) = 2b^2y$
$F_z(x, y, z) = -2z$
Plane: $2a^2x_0(x - x_0) + 2b^2y_0(y - y_0) - 2z_0(z - z_0) = 0$
$a^2x_0x + b^2y_0y - z_0z = 0$
So, the plane passes through the origin.

63. (a) $P_1(x, y) = 1 + x - y$
(b) $P_2(x, y) = 1 + x - y + \frac{1}{2}x^2 - xy + \frac{1}{2}y^2$
(c) If $x = 0$, $P_2(0, y) = 1 - y + \frac{1}{2}y^2$.
This is the second-degree Taylor polynomial for e^{-y}.
If $y = 0$, $P_2(x, 0) = 1 + x + \frac{1}{2}x^2$.
This is the second-degree Taylor polynomial for e^x.

(d)

x	y	$f(x, y)$	$P_1(x, y)$	$P_2(x, y)$
0	0	1	1	1
0	0.1	0.9048	0.9000	0.9050
0.2	0.1	1.1052	1.1000	1.1050
0.2	0.5	0.7408	0.7000	0.7450
1	0.5	1.6487	1.5000	1.6250

(e)



65. Proof

Section 13.8 *(page 946)*

1. (a) To say that f has a relative minimum at (x_0, y_0) means that the point (x_0, y_0, z_0) is at least as low as all nearby points on the graph of $z = f(x, y)$.

(b) To say that f has a relative maximum at (x_0, y_0) means that the point (x_0, y_0, z_0) is at least as high as all nearby points in the graph of $z = f(x, y)$.

(c) Critical points of f are the points at which the gradient of f is 0 or the points at which one of the partial derivatives does not exist.

(d) A critical point is a saddle point if it is neither a relative minimum nor a relative maximum.

3. Relative minimum: $(1, 3, 0)$

5. Relative minimum: $(0, 0, 1)$

7. Relative minimum: $(-1, 3, -4)$

9. Relative minimum: $(-4, 6, -55)$

11. Every point along the x- or y-axis is a critical point. Each of the critical points yields an absolute maximum.

13. Relative maximum: $\left(\frac{1}{2}, -1, \frac{31}{4}\right)$

15. Relative minimum: $\left(\frac{1}{2}, -4, -\frac{187}{4}\right)$

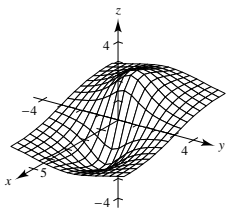
17. Relative minimum: $(3, -4, -5)$

19. Relative maximum: $(0, 0, -12)$

21. Saddle point: $(1, -1, -1)$

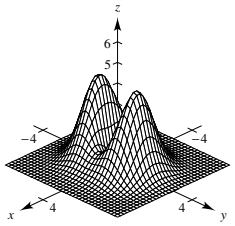
23. No critical numbers

25.



Relative maximum: $(-1, 0, 2)$
Relative minimum: $(1, 0, -2)$

27.



Relative minimum: $(0, 0, 0)$
Relative maxima: $(0, \pm 1, 4)$
Saddle points: $(\pm 1, 0, 1)$

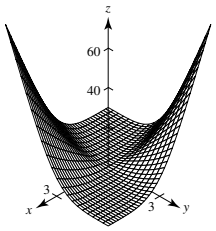
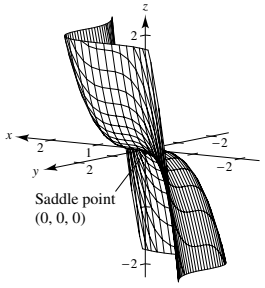
29. z is never negative. Minimum: $z = 0$ when $x = y \neq 0$.



31. Insufficient information **33.** Saddle point

35. (a) $(0, 0)$ (b) Saddle point: $(0, 0, 0)$ (c) $(0, 0)$

(d)

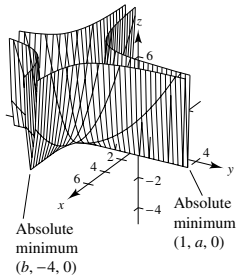


37. (a) $(1, a)$, $(b, -4)$

(b) Absolute minima: $(1, a, 0)$, $(b, -4, 0)$

(c) $(1, a)$, $(b, -4)$

(d)



39. Absolute maximum: $(4, 0, 21)$
Absolute minimum: $(4, 2, -11)$

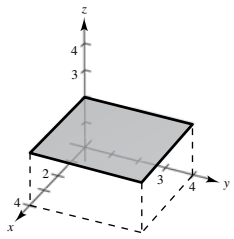
41. Absolute maximum: $(0, 1, 10)$
Absolute minimum: $(1, 2, 5)$

43. Absolute maxima: $(\pm 2, 4, 28)$
Absolute minimum: $(0, 1, -2)$

45. Absolute maxima: $(-2, -1, 9)$, $(2, 1, 9)$
Absolute minima: $(x, -x, 0)$, $|x| \leq 1$

47. Relative minimum: $(0, 3, -1)$ **49.** $-4 < f_{xy}(3, 7) < 4$

51.



Extrema at all (x, y)

53. (a) $f_x = 2x = 0$, $f_y = -2y = 0 \implies (0, 0)$ is a critical point.
$g_x = 2x = 0$, $g_y = 2y = 0 \implies (0, 0)$ is a critical point.

(b) $d = 2(-2) - 0 < 0 \implies (0, 0)$ is a saddle point.
$d = 2(2) - 0 > 0 \implies (0, 0)$ is a relative minimum.

55. False. Let $f(x, y) = 1 - |x| - |y|$ at the point $(0, 0, 1)$.

57. False. Let $f(x, y) = x^2y^2$ (see Example 4 on page 944).

Section 13.9 *(page 953)*

1. Write the equation to be maximized or minimized as a function of two variables. Take the partial derivatives and set them equal to zero or undefined to obtain the critical points. Use the Second Partials Test to test for relative extrema using the critical points. Check the boundary points.

3. $\sqrt{3}$ **5.** $\sqrt{7}$ **7.** $x = y = z = 3$

9. $x = y = z = 10$ **11.** 9 ft × 9 ft × 8.25 ft; \$26.73

13. Let x, y, and z be the length, width, and height, respectively, and let V_0 be the given volume. Then $V_0 = xyz$ and $z = \dfrac{V_0}{xy}$.

The surface area is

$$S = 2xy + 2yz + 2xz = 2\left(xy + \frac{V_0}{x} + \frac{V_0}{y}\right).$$

$$\left.\begin{aligned} S_x &= 2\left(y - \frac{V_0}{x^2}\right) = 0 \\ S_y &= 2\left(x - \frac{V_0}{y^2}\right) = 0 \end{aligned}\right\} \begin{aligned} x^2y - V_0 &= 0 \\ xy^2 - V_0 &= 0 \end{aligned}$$

So, $x = \sqrt[3]{V_0}$, $y = \sqrt[3]{V_0}$, and $z = \sqrt[3]{V_0}$.

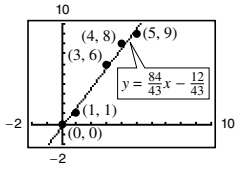
15. $x_1 = 3$, $x_2 = 6$ **17.** Proof

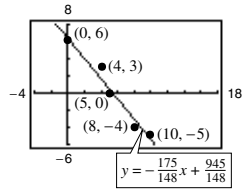
19. $x = \dfrac{\sqrt{2}}{2} \approx 0.707$ km

$y = \dfrac{3\sqrt{2} + 2\sqrt{3}}{6} \approx 1.284$ km

21. (a) $y = \frac{3}{4}x + \frac{4}{3}$ (b) $\frac{1}{6}$ **23.** (a) $y = -2x + 4$ (b) 2

25. $y = \frac{84}{43}x - \frac{12}{43}$ **27.** $y = -\frac{175}{148}x + \frac{945}{148}$





29. (a) $y = 0.636x - 10.095$ (b) \$816.71 billion
(c) The new model is $y = 0.6302x + 5.973$.

31. $a\sum_{i=1}^{n} x_i^4 + b\sum_{i=1}^{n} x_i^3 + c\sum_{i=1}^{n} x_i^2 = \sum_{i=1}^{n} x_i^2 y_i$

$a\sum_{i=1}^{n} x_i^3 + b\sum_{i=1}^{n} x_i^2 + c\sum_{i=1}^{n} x_i = \sum_{i=1}^{n} x_i y_i$

$a\sum_{i=1}^{n} x_i^2 + b\sum_{i=1}^{n} x_i + cn = \sum_{i=1}^{n} y_i$

33. $y = \frac{3}{7}x^2 + \frac{6}{5}x + \frac{26}{35}$ **35.** $y = x^2 - x$

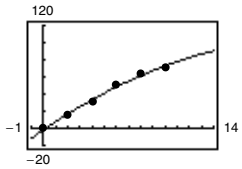
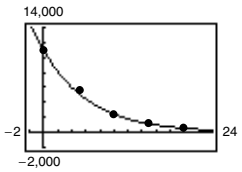
37. (a) $y = -0.22x^2 + 9.66x - 1.79$

(b)



39. (a) $\ln P = -0.1499h + 9.3018$ (b) $P = 10{,}957.7e^{-0.1499h}$

(c)



41. Proof

Section 13.10 *(page 962)*

1. Optimization problems that have restrictions or constraints on the values that can be used to produce the optimal solutions are called constrained optimization problems.

3. $f(5, 5) = 25$ **5.** $f(1, 2) = 5$ **7.** $f(25, 50) = 2600$

9. $f(1, 1) = 2$ **11.** $f(3, 3, 3) = 27$ **13.** $f\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right) = \frac{1}{3}$

15. Maxima: $f\left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right) = \frac{5}{2}$

$f\left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right) = \frac{5}{2}$

Minima: $f\left(-\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right) = -\frac{1}{2}$

$f\left(\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}\right) = -\frac{1}{2}$

17. $f(8, 16, 8) = 1024$ **19.** $\frac{\sqrt{2}}{2}$ **21.** $3\sqrt{2}$ **23.** $\frac{\sqrt{11}}{2}$

25. 2 **27.** $\sqrt{3}$ **29.** $(-4, 0, 4)$ **31.** $\sqrt{3}$

33. $x = y = z = 3$ **35.** 9 ft × 9 ft × 8.25 ft; \$26.73

37. Proof **39.** $\frac{2\sqrt{3}a}{3} \times \frac{2\sqrt{3}b}{3} \times \frac{2\sqrt{3}c}{3}$

41. At (0, 0), the Lagrange equations are inconsistent.

43. $\sqrt[3]{360} \times \sqrt[3]{360} \times \frac{4}{3}\sqrt[3]{360}$ ft

45. $r = \sqrt[3]{\frac{v_0}{2\pi}}$ and $h = 2\sqrt[3]{\frac{v_0}{2\pi}}$ **47.** Proof

49. $P\left(\frac{15{,}625}{28}, 3125\right) \approx 203{,}144$

51. $x \approx 237.4$

$y \approx 640.9$

Cost ≈ \$68,364.80

53. Putnam Problem 2, morning session, 1938

Review Exercises for Chapter 13 *(page 964)*

1. Find the domain and range of the function. Then use traces in planes parallel to the coordinate planes.

3. z is not a function of x and y. The graph is of an ellipsoid, so there exists inputs for x and y that give multiple values for z.

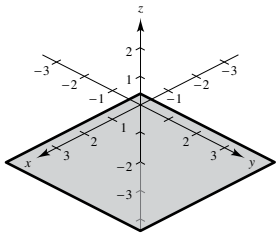
5. A and B may be relative extrema; C and D may be saddle points.

7. (a) -3 (b) -7 (c) 15 (d) $7x^2 - 3$

9. Domain: $\{(x, y): x \geq 0 \text{ and } y \neq 0\}$

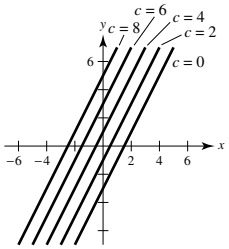
Range: all real numbers

11.

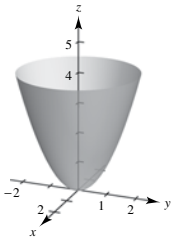


Plane

13. Lines: $y = 2x - 3 + c$



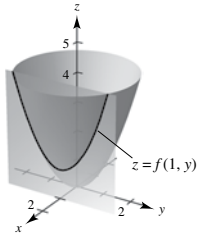
15. (a)

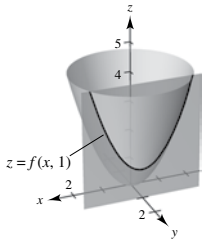


(b) g is a vertical translation of f two units upward.

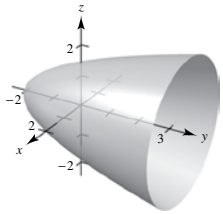
(c) g is a horizontal translation of f two units to the right.

(d)





17. Elliptic paraboloid



19. Limit: $\frac{1}{2}$

Continuous except at (0, 0)

21. Limit: 0

Continuous

23. Limit: $-\frac{\ln 2}{5}$

Continuous for $x \neq \frac{z}{y}$

25. $f_x(x, y) = 15x^2$

$f_y(x, y) = 7$

27. $f_x(x, y) = e^x \cos y$

$f_y(x, y) = -e^x \sin y$

29. $f_x(x, y) = -\frac{y^4}{x^2}e^{y/x}$

$f_y(x, y) = \frac{y^3}{x}e^{y/x} + 3y^2e^{y/x}$

31. $f_x(x, y, z) = 2z^2 + 6yz$

$f_y(x, y, z) = 6xz$

$f_z(x, y, z) = 4xz + 6xy$

33. $f_x(0, 2) = 0$
$f_y(0, 2) = -1$

35. $f_x\left(2, 3, -\frac{\pi}{3}\right) = -\sqrt{3}\pi - \frac{3}{2}$

$f_y\left(2, 3, -\frac{\pi}{3}\right) = -1$

$f_z\left(2, 3, -\frac{\pi}{3}\right) = 6\sqrt{3}$

37. $f_{xx}(x, y) = 6$
$f_{yy}(x, y) = 12y$
$f_{xy}(x, y) = f_{yx}(x, y) = -1$

39. $h_{xx}(x, y) = -y \cos x$
$h_{yy}(x, y) = -x \sin y$
$h_{xy}(x, y) = h_{yx}(x, y) = \cos y - \sin x$

41. Slope in x-direction: 0
Slope in y-direction: 4

43. $(xy \cos xy + \sin xy)\,dx + (x^2 \cos xy)\,dy$

45. $(3y^2 - 6x^2yz^2)\,dx + (6xy - 2x^3z^2)\,dy + (-4x^3yz)\,dz$

47. (a) $f(2, 1) = 10$ (b) $dz = 0.5$
$f(2.1, 1.05) = 10.5$
$\Delta z = 0.5$

49. $dV = \pm\pi$ in.^{3}, $\frac{dV}{V} = 15\%$ **51.** Proof

53. (a) and (b) $\frac{dw}{dt} = \frac{8t - 1}{4t^2 - t + 4}$

55. (a) and (b) $\frac{dw}{dt} = 2t^2e^{2t} + 2te^{2t} + 2t + 1$

57. (a) and (b) $\frac{\partial w}{\partial r} = \frac{4r^2t - 4rt^2 - t^3}{(2r - t)^2}$
$\frac{\partial w}{\partial t} = \frac{4r^2t - rt^2 - 4r^3}{(2r - t)^2}$

59. $\frac{-3x^2 + y}{-x + 5}$

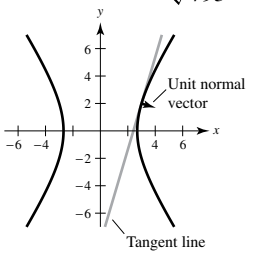
61. $\frac{\partial z}{\partial x} = \frac{-2x - y}{y + 2z}$
$\frac{\partial z}{\partial y} = \frac{-x - 2y - z}{y + 2z}$

63. -50 **65.** $\frac{2}{3}$ **67.** $\langle 4, 4\rangle$, $4\sqrt{2}$ **69.** $\left\langle -\frac{1}{2}, 0\right\rangle$, $\frac{1}{2}$

71. $\langle -2, -3, -1\rangle$, $\sqrt{14}$

73. (a) $54\mathbf{i} - 16\mathbf{j}$ (b) $\frac{27}{\sqrt{793}}\mathbf{i} - \frac{8}{\sqrt{793}}\mathbf{j}$ (c) $y = \frac{27}{8}x - \frac{65}{8}$

(d)



75. $2x + 6y - z = 8$ **77.** $z = 4$

79. (a) $4x + 4y - z = 8$
(b) $x = 2 + 4t$, $y = 1 + 4t$, $z = 4 - t$

81. 36.7° **83.** $(0, 0, 9)$

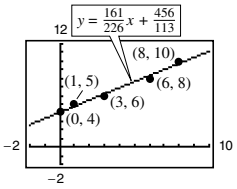
85. Relative maximum: $(4, -1, 9)$

87. Relative minimum: $\left(-4, \frac{4}{3}, -2\right)$

89. Relative minimum: $(1, 1, 3)$ **91.** $\sqrt{3}$

93. $x_1 = 2$, $x_2 = 4$

95. $y = \frac{161}{226}x + \frac{456}{113}$



97. $y = 0.138x + 22.1$; 46.25 bushels/acre

99. $f(4, 4) = 32$ **101.** $f(15, 7) = 352$ **103.** $f(3, 6) = 36$

105. $x = \frac{\sqrt{2}}{2} \approx 0.707$ km, $y = \frac{\sqrt{3}}{3} \approx 0.577$ km,
$z = \left(60 - 3\sqrt{2} - 2\sqrt{3}\right)6 \approx 8.716$ km

107. $\frac{\partial P}{\partial V} = \frac{2an^2}{V^3} - \frac{nRT}{(V - nb)^2}$, $\frac{\partial T}{\partial P} = \frac{1}{nR}(V - nb)$

P.S. Problem Solving *(page 968)*

1. (a) $y_0z_0(x - x_0) + x_0z_0(y - y_0) + x_0y_0(z - z_0) = 0$

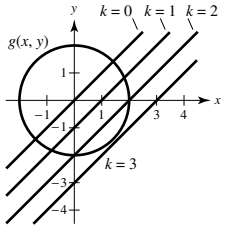
(b) $x_0y_0z_0 = 1 \implies z_0 = \frac{1}{x_0y_0}$

Then the tangent plane is

$$y_0\left(\frac{1}{x_0y_0}\right)(x - x_0) + x_0\left(\frac{1}{x_0y_0}\right)(y - y_0) + x_0y_0\left(z - \frac{1}{x_0y_0}\right) = 0.$$

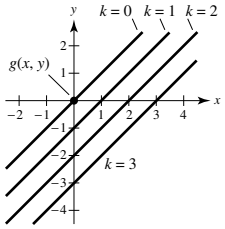
Intercepts: $(3x_0, 0, 0)$, $(0, 3y_0, 0)$, $\left(0, 0, \frac{3}{x_0y_0}\right)$

3. (a)



Maximum value: $2\sqrt{2}$

(b)



Maximum and minimum value: 0
The method of Lagrange multipliers does not work because $\nabla g(x_0, y_0) = \mathbf{0}$.

5. (a) $x\frac{\partial f}{\partial x} + y\frac{\partial f}{\partial y} = xCy^{1-a}ax^{a-1} + yCx^a(1 - a)y^{1-a-1}$
$= ax^aCy^{1-a} + (1 - a)x^aC(y^{1-a})$
$= Cx^ay^{1-a}[a + (1 - a)]$
$= Cx^ay^{1-a}$
$= f(x, y)$

(b) $f(tx, ty) = C(tx)^a(ty)^{1-a}$
$= Ctx^ay^{1-a}$
$= tCx^ay^{1-a}$
$= tf(x, y)$

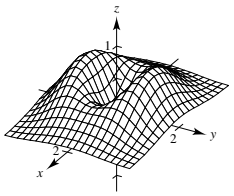
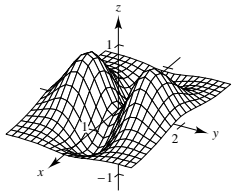
7. (a)



Minimum: $(0, 0, 0)$
Maxima: $(0, \pm 1, 2e^{-1})$
Saddle points: $(\pm 1, 0, e^{-1})$

(b)



Minima: $(\pm 1, 0, -e^{-1})$
Maxima: $(0, \pm 1, 2e^{-1})$
Saddle point: $(0, 0, 0)$

(c) $\alpha > 0$
Minimum: $(0, 0, 0)$
Maxima: $(0, \pm 1, \beta e^{-1})$
Saddle points: $(\pm 1, 0, \alpha e^{-1})$

$\alpha < 0$
Minima: $(\pm 1, 0, \alpha e^{-1})$
Maxima: $(0, \pm 1, \beta e^{-1})$
Saddle point: $(0, 0, 0)$

9–13. Proofs

Chapter 14

Section 14.1 *(page 976)*

1. An iterated integral is an integral of a function of several variables. Integrate with respect to one variable while holding the other variables constant.

3. $\frac{3x^2}{2}$ **5.** $\frac{4x^2 - x^4}{2}$ **7.** $\frac{y}{2}[(\ln y)^2 - y^2]$

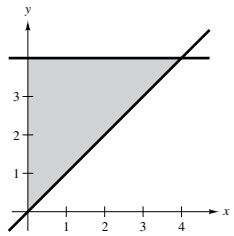
9. $x^2(1 - e^{-x^2} - x^2e^{-x^2})$ **11.** 3 **13.** $\frac{\sqrt{2}}{4}$ **15.** 64

17. $\frac{3}{2}$ **19.** $\frac{1}{3}$ **21.** $\frac{2}{3}$ **23.** 4 **25.** $\frac{\pi}{2}$ **27.** $\frac{\pi^2}{32} + \frac{1}{8}$

29. $\frac{1}{2}$ **31.** Diverges **33.** 8 **35.** $\frac{16}{3}$ **37.** 36

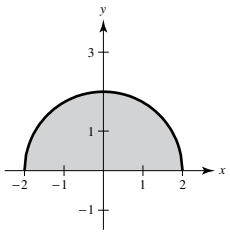
39. $\frac{8}{3}$ **41.** $\frac{9}{2}$

43.



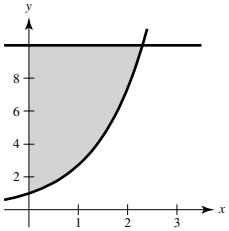
$$\int_0^4 \int_x^4 f(x, y)\, dy\, dx$$

45.



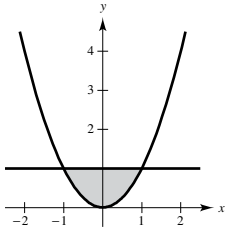
$$\int_0^2 \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} f(x, y)\, dx\, dy$$

47.



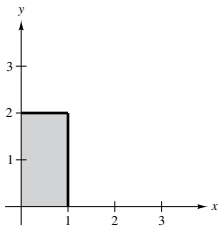
$$\int_0^{\ln 10} \int_{e^x}^{10} f(x, y)\, dy\, dx$$

49.



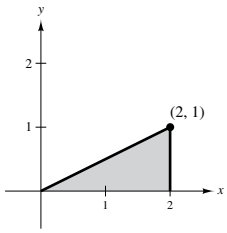
$$\int_0^1 \int_{-\sqrt{y}}^{\sqrt{y}} f(x, y)\, dx\, dy$$

51.



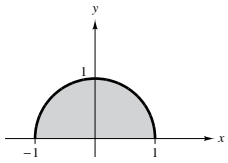
$$\int_0^1 \int_0^2 dy\, dx = \int_0^2 \int_0^1 dx\, dy = 2$$

53.



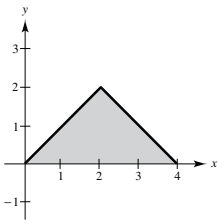
$$\int_0^1 \int_{2y}^2 dx\, dy = \int_0^2 \int_0^{x/2} dy\, dx = 1$$

55.



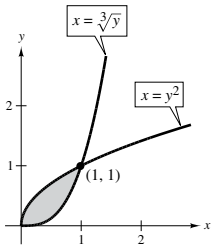
$$\int_0^1 \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} dx\, dy = \int_{-1}^1 \int_0^{\sqrt{1-x^2}} dy\, dx = \frac{\pi}{2}$$

57.



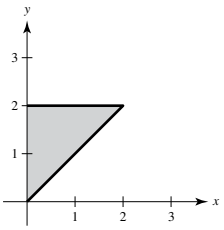
$$\int_0^2 \int_0^x dy\, dx + \int_2^4 \int_0^{4-x} dy\, dx = \int_0^2 \int_y^{4-y} dx\, dy = 4$$

59.



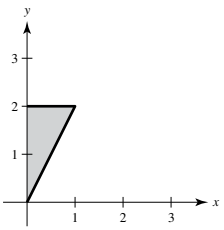
$$\int_0^1 \int_{y^2}^{\sqrt[3]{y}} dx\, dy = \int_0^1 \int_{x^3}^{\sqrt{x}} dy\, dx = \frac{5}{12}$$

61.



$$\int_0^2 \int_x^2 x\sqrt{1 + y^3}\, dy\, dx = \frac{26}{9}$$

63.



$$\int_0^1 \int_{2x}^2 4e^{y^2}\, dy\, dx = e^4 - 1 \approx 53.598$$

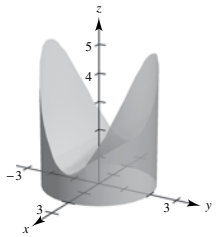
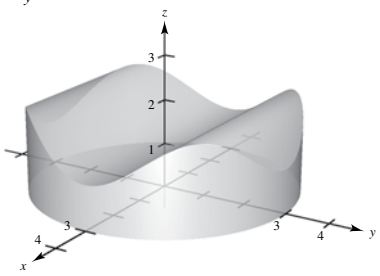
73. (a) $12\pi \approx 37.70 \text{ cm}^2$ (b) $\frac{12\pi}{5} \approx 7.54 \text{ cm}^3$

(c)



75. $I_x = I_y = a^3\pi$

77. (a)



(b) $9\pi \text{ cm}^2 \approx 28.274 \text{ cm}^2$ (c) $\frac{27\pi}{2} \text{ cm}^3 \approx 42.412 \text{ cm}^3$

79. 1750 ft-lb **81.** No. $y = 2x$, so $dy = 2\,dx$.

83. z_3, z_1, z_2, z_4; The greater the height of the surface over the curve $y = \sqrt{x}$, the greater the lateral surface area.

85. False. $\displaystyle\int_C xy\,ds = \sqrt{2}\int_0^1 t^2\,dt$ **87.** -12

Section 15.3 *(page 1076)*

1. Verify that the vector field is conservative. Find a potential function. Calculate the difference of the values of the function evaluated at the endpoints.

3. (a) Proof

(b) $\displaystyle\int_{C_1} \mathbf{F}\cdot d\mathbf{r} = \int_0^1 (t^2 + 2t^3)\,dt = \frac{5}{6}$

$\displaystyle\int_{C_2} \mathbf{F}\cdot d\mathbf{r} = \int_0^{\pi/2} (\sin^2\theta\cos\theta + 2\sin^3\theta\cos\theta)\,d\theta = \frac{5}{6}$

5. (a) Proof

(b) $\displaystyle\int_{C_1} \mathbf{F}\cdot d\mathbf{r} = \int_0^{\pi/3} (3\tan^2\theta\sec\theta + 3\sec^3\theta)\,d\theta \approx 10.392$

$\displaystyle\int_{C_2} \mathbf{F}\cdot d\mathbf{r} = \int_0^3 \left(\frac{3\sqrt{t}}{2\sqrt{t+1}} + \frac{3\sqrt{t+1}}{2\sqrt{t}}\right) dt \approx 10.392$

7. (a) Proof

(b) $\displaystyle\int_{C_1} \mathbf{F}\cdot d\mathbf{r} = \int_0^1 64t^3\,dt = 16$

$\displaystyle\int_{C_2} \mathbf{F}\cdot d\mathbf{r} = \int_0^{\pi/2} 64\sin^3\theta\cos\theta\,d\theta = 16$

9. 72 **11.** -1 **13.** 0 **15.** (a) 2 (b) 2 (c) 2

17. 11 **19.** (a) Proof (b) 30,366

25. (a) 64 (b) 0 (c) 0 (d) 0

27. (a) 32 (b) 32 **29.** (a) $\frac{2}{3}$ (b) $\frac{17}{6}$ **31.** (a) 0 (b) 0

33. 0

35. (a) $d\mathbf{r} = (\mathbf{i} - \mathbf{j})\,dt \implies \displaystyle\int_0^{50} 175\,dt = 8750 \text{ ft-lb}$

(b) $d\mathbf{r} = \left(\mathbf{i} - \frac{1}{25}(50 - t)\mathbf{j}\right) dt$

$\displaystyle 7\int_0^{50} (50 - t)\,dt = 8750 \text{ ft-lb}$

37. $\mathbf{F}$ is conservative because $\nabla\left(\arctan\frac{x}{y}\right) = \mathbf{F}$. Furthermore, the closed path C lies above the x-axis. Hence, the line integral equals 0.

39. 1.125

41. Yes, because the work required to get from point to point is independent of the path taken.

43. False. It would be true if $\mathbf{F}$ were conservative.

45. True **47.** Proof

49. (a) Proof (b) $-\pi$ (c) π (d) -2π

(e) No, because $\mathbf{F}$ is not continuous at $(0, 0)$ in R enclosed by C.

(f) $\nabla\left(\arctan\frac{x}{y}\right) = \frac{1/y}{1 + (x/y)^2}\mathbf{i} + \frac{-x/y^2}{1 + (x/y)^2}\mathbf{j}$

Section 15.4 *(page 1085)*

1. A curve is simple when it does not cross itself. A connected plane region is simply connected when every simple closed curve in the region encloses only points that are in the region. For example, a region with a hole is not simply connected.

3. You are working with a simple closed curve with a boundary whose orientation is counterclockwise.

5. $\frac{1}{30}$ **7.** 0 **9.** About 19.99 **11.** $\frac{9}{2}$ **13.** 56

21. Putnam Problem A5, 1987

Review Exercises for Chapter 15 *(page 1124)*

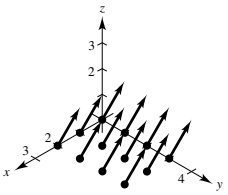
1. (a) A vector field $\mathbf{F}$ is conservative when there exists a differentiable function f such that $\mathbf{F} = \nabla f$.

(b) A potential function for $\mathbf{F}$ is the differentiable function f such that $\mathbf{F} = \nabla f$.

3. Proof; Answers will vary.

5. If $\mathbf{F}$ is a continuous vector field on a smooth curve C given by $\mathbf{r}(t)$, $a \le x \le b$, then the line integral of $\mathbf{F}$ on C is $\int_C \mathbf{F}\,d\mathbf{r} = \int_C \mathbf{F}\cdot\mathbf{T}\,ds$, which can be evaluated as the definite integral $\int_a^b \mathbf{F}(x(t), y(t), z(t))\cdot\mathbf{r}'(t)\,dt$.

7. $\sqrt{x^2+5}$



9. $y\cos xy\mathbf{i} + (x\cos xy - 2y)\mathbf{j}$ **11.** $(4x+y)\mathbf{i} + x\mathbf{j} + 2z\mathbf{k}$

13. Not conservative **15.** Conservative

17. Conservative; $f(x,y) = \frac{y}{x} + K$

19. Conservative; $f(x,y) = \frac{1}{2}x^2y^2 - \frac{1}{3}x^3 + \frac{1}{3}y^3 + K$

21. Not conservative **23.** Conservative; $f(x,y,z) = \frac{x}{yz} + K$

25. (a) $\operatorname{div}\mathbf{F} = 2x + 2xy + x^2$ (b) $\operatorname{curl}\mathbf{F} = -2xz\mathbf{j} + y^2\mathbf{k}$

27. (a) $\operatorname{div}\mathbf{F} = -y\sin x - x\cos y + xy$

(b) $\operatorname{curl}\mathbf{F} = xz\mathbf{i} - yz\mathbf{j}$

29. (a) $\operatorname{div}\mathbf{F} = \frac{1}{\sqrt{1-x^2}} + 2xy + 2yz$

(b) $\operatorname{curl}\mathbf{F} = z^2\mathbf{i} + y^2\mathbf{k}$

31. (a) $\operatorname{div}\mathbf{F} = \frac{2x+2y}{x^2+y^2} + 1$ (b) $\operatorname{curl}\mathbf{F} = \frac{2x-2y}{x^2+y^2}\mathbf{k}$

Parameter, 700
arc length, 856, 857
eliminating, 702
Parametric equations, 700
finding, 704
graph of, 700
of a line in space, 787
for a surface, 1088
Parametric form
of arc length, 713
of the area of a surface of revolution, 714
of the derivative, 710
higher-order, 711
Parametric surface, 1088
area of, 1092
equations for, 1088
partial derivatives of, 1091
smooth, 1091
normal vector to, 1091
surface area of, 1092
Partial derivatives, 894
first, 894
of a function of three or more variables, 897
of a function of two variables, 894
higher-order, 898
mixed, 898
equality of, 899
notation for, 895
of a parametric surface, 1091
Partial differentiation, 894
Partial fractions, 550
decomposition of $N(x)/D(x)$ into, 551
method of, 550
Partial sum(s)
*n*th, 599
of geometric series, 601
sequence of, 599
Particular solution of a differential equation, 253, 407
Partition
general, 271
inner, 978, 1013
polar, 991
norm of, 271, 978, 1013
polar, 991
regular, 271
Pascal, Blaise (1623–1662), 505
Pascal's Principle, 505
Path, 885, 1055
Pear-shaped quartic, 164
Percent error, 237
Perigee, 698
Perihelion, 698, 745
Period of a function, 36
Periodic function, 36
Perpendicular
lines, 14
planes, 789
vectors, 772
Piecewise smooth curve, 705, 1055
Planar lamina, 498
center of mass of, 498
moment of, 498
Plane
angle of inclination of, 935
distance between a point and, 792
region
area of, 264
simply connected, 1048, 1079
tangent, 932
equation of, 932
vector in, 752
Plane curve, 700, 820
orientation of, 701
smooth, 1055
Plane(s) in space
angle between two, 789
equation of
general form, 788
standard form, 788
parallel, 789
to the axis, 791
to the coordinate plane, 791
perpendicular, 789
trace of, 791
Point
as a degenerate conic, 686
of diminishing returns, 227

ALGEBRA

Factors and Zeros of Polynomials

Let $p(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$ be a polynomial. If $p(a) = 0$, then a is a *zero* of the polynomial and a solution of the equation $p(x) = 0$. Furthermore, $(x - a)$ is a *factor* of the polynomial.

Fundamental Theorem of Algebra

An nth degree polynomial has n (not necessarily distinct) zeros. Although all of these zeros may be imaginary, a real polynomial of odd degree must have at least one real zero.

Quadratic Formula

If $p(x) = ax^2 + bx + c$, and $0 \le b^2 - 4ac$, then the real zeros of p are $x = \left(-b \pm \sqrt{b^2 - 4ac}\right)/2a$.

Special Factors

$$x^2 - a^2 = (x - a)(x + a)$$

$$x^3 - a^3 = (x - a)(x^2 + ax + a^2)$$

$$x^3 + a^3 = (x + a)(x^2 - ax + a^2)$$

$$x^4 - a^4 = (x - a)(x + a)(x^2 + a^2)$$

Binomial Theorem

$$(x + y)^2 = x^2 + 2xy + y^2$$

$$(x - y)^2 = x^2 - 2xy + y^2$$

$$(x + y)^3 = x^3 + 3x^2y + 3xy^2 + y^3$$

$$(x - y)^3 = x^3 - 3x^2y + 3xy^2 - y^3$$

$$(x + y)^4 = x^4 + 4x^3y + 6x^2y^2 + 4xy^3 + y^4$$

$$(x - y)^4 = x^4 - 4x^3y + 6x^2y^2 - 4xy^3 + y^4$$

$$(x + y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2!}x^{n-2}y^2 + \cdots + nxy^{n-1} + y^n$$

$$(x - y)^n = x^n - nx^{n-1}y + \frac{n(n-1)}{2!}x^{n-2}y^2 - \cdots \pm nxy^{n-1} \mp y^n$$

Rational Zero Theorem

If $p(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$ has integer coefficients, then every *rational zero* of p is of the form $x = r/s$, where r is a factor of a_0 and s is a factor of a_n.

Factoring by Grouping

$$acx^3 + adx^2 + bcx + bd = ax^2(cx + d) + b(cx + d) = (ax^2 + b)(cx + d)$$

Arithmetic Operations

$$ab + ac = a(b + c)$$

$$\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}$$

$$\frac{a + b}{c} = \frac{a}{c} + \frac{b}{c}$$

$$\frac{\left(\frac{a}{b}\right)}{\left(\frac{c}{d}\right)} = \left(\frac{a}{b}\right)\left(\frac{d}{c}\right) = \frac{ad}{bc}$$

$$\frac{\left(\frac{a}{b}\right)}{c} = \frac{a}{bc}$$

$$\frac{a}{\left(\frac{b}{c}\right)} = \frac{ac}{b}$$

$$a\left(\frac{b}{c}\right) = \frac{ab}{c}$$

$$\frac{a - b}{c - d} = \frac{b - a}{d - c}$$

$$\frac{ab + ac}{a} = b + c$$

Exponents and Radicals

$$a^0 = 1, \quad a \neq 0$$

$$(ab)^x = a^x b^x$$

$$a^x a^y = a^{x+y}$$

$$\sqrt{a} = a^{1/2}$$

$$\frac{a^x}{a^y} = a^{x-y}$$

$$\sqrt[n]{a} = a^{1/n}$$

$$\left(\frac{a}{b}\right)^x = \frac{a^x}{b^x}$$

$$\sqrt[n]{a^m} = a^{m/n}$$

$$a^{-x} = \frac{1}{a^x}$$

$$\sqrt[n]{ab} = \sqrt[n]{a}\sqrt[n]{b}$$

$$(a^x)^y = a^{xy}$$

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$$

FORMULAS FROM GEOMETRY

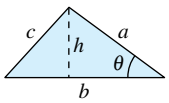
Triangle

$h = a \sin \theta$

Area $= \frac{1}{2}bh$

(Law of Cosines)

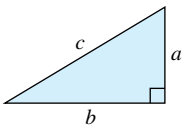
$c^2 = a^2 + b^2 - 2ab \cos \theta$



Right Triangle

(Pythagorean Theorem)

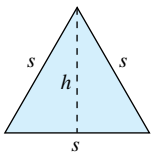
$c^2 = a^2 + b^2$



Equilateral Triangle

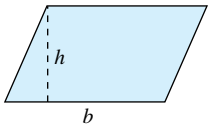
$h = \frac{\sqrt{3}s}{2}$

Area $= \frac{\sqrt{3}s^2}{4}$



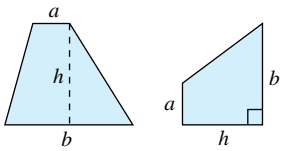
Parallelogram

Area $= bh$



Trapezoid

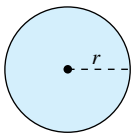
Area $= \frac{h}{2}(a + b)$



Circle

Area $= \pi r^2$

Circumference $= 2\pi r$

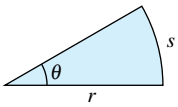


Sector of Circle

(θ in radians)

Area $= \frac{\theta r^2}{2}$

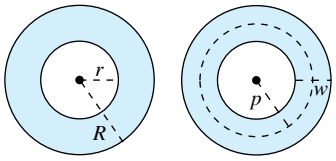
$s = r\theta$



Circular Ring

(p = average radius,
w = width of ring)

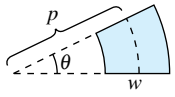
Area $= \pi(R^2 - r^2)$
$= 2\pi pw$



Sector of Circular Ring

(p = average radius,
w = width of ring,
θ in radians)

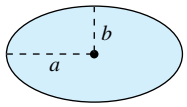
Area $= \theta pw$



Ellipse

Area $= \pi ab$

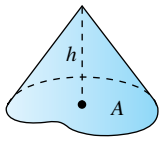
Circumference $\approx 2\pi \sqrt{\frac{a^2 + b^2}{2}}$



Cone

(A = area of base)

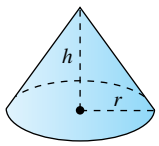
Volume $= \frac{Ah}{3}$



Right Circular Cone

Volume $= \frac{\pi r^2 h}{3}$

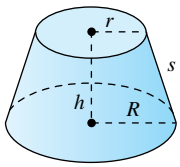
Lateral Surface Area $= \pi r\sqrt{r^2 + h^2}$



Frustum of Right Circular Cone

Volume $= \frac{\pi(r^2 + rR + R^2)h}{3}$

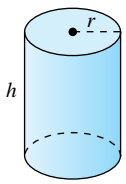
Lateral Surface Area $= \pi s(R + r)$



Right Circular Cylinder

Volume $= \pi r^2 h$

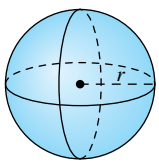
Lateral Surface Area $= 2\pi rh$



Sphere

Volume $= \frac{4}{3}\pi r^3$

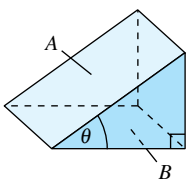
Surface Area $= 4\pi r^2$



Wedge

(A = area of upper face,
B = area of base)

$A = B \sec \theta$



Tear out Formula Cards for Homework Success.

Index of Applications (continued from front inside cover)

Torque, 783, 785, 816
Torricelli's Law, 442
Tossing bales, 843
Tractrix, 323, 395, 399, 549, 718
Velocity, 117, 121, 156, 180, 294, 295, 452, 586
Velocity and acceleration, 312, 431
  on the moon, 164
Velocity in a resisting medium, 371
Vertical motion, 120, 162, 178, 179, 254, 256, 309, 310, 389
Vibrating string, 162, 531
Wave equation, 901, 968
Wave motion, 142
Wind chill, 910
Work, 512, 514, 565
  done in closing a door, 776
  done by an expanding gas, 490
  done by a force field, 1066, 1068, 1077, 1125
  done by hoisting a car, 491
  done by a hydraulic cylinder, 493, 571
  done by a hydraulic press, 493
  done in lifting a box, 493
  done in lifting a chain, 490, 492
  done in lifting a steel beam, 491
  done in moving a particle, 1068, 1085
  done by a person walking up a staircase, 1068
  done by propelling a rocket, 580
  done in propelling a satellite, 491, 512
  done in pulling an object, 815
  done in pulling a pallet truck, 778
  done in pulling a train car, 491
  done in pulling a wagon, 778
  done in pumping gasoline, 492
  done in pumping water, 491, 492, 512
  done in sliding a cement block, 491
  done in splitting a piece of wood, 493
  done in towing a car, 778
  done in winding a chain, 492, 512

Business and Economics

Annuities, 607
Apartment rental, 18
Average cost, 198
Average price, 332
Average production, 988
Average profit, 1039
Biomass-based diesel fuel production, 17
Break-even analysis, 42
Break-even point, 9
Building a pipeline, 955
Capitalized cost, 581
Cobb-Douglas production function, 877, 882, 883, 959, 965, 968
Compound interest, 356, 357, 359, 360, 371, 402, 421, 440, 597, 681
Cost, 97, 121, 142, 178, 244, 340, 422, 558, 883
Declining sales, 418
Depreciation, 143, 307, 349, 359, 402, 606, 681
Eliminating budget deficits, 452
Government expenditures, 597
Gross Domestic Product (GDP), 9
Gross income tax collections, 954
Health care expenditures, 131, 903
Home mortgage, 323
Income distribution in a country, 452
Inflation, 359, 597
Inventory management, 85, 121
Inventory replenishment, 130
Investment, 882, 902
Investment growth, 436
Manufacturing, 459, 463
Marginal costs, 902
Marginal productivity, 902
Marginal productivity of money, 959
Marginal revenue, 902
Marginal utility, 903
Marketing, 606, 681
Maximum profit, 227, 949, 953, 966
Maximum revenue, 953, 966
Medicare Hospital Insurance Trust Fund, 189
Minimum cost, 226, 953, 963, 967
Multiplier effect, 606
Outlays for national defense, 244
Personal consumption expenditures, 796, 903
Present value, 531, 585, 607
Profit, 452
Revenue, 452, 512, 778
Salary, 607
Sales, 40, 179, 196, 307, 332, 440, 883
Sales growth, 198, 244
Veterans with service-connected disabilities, 955

Social and Behavioral Sciences

Cell phone subscriptions, 9
Free lunch program, 160
Group project in learning theory, 360
Learning curve, 436
Memory model, 531
Population, 12, 16, 421, 598, 996
Population growth, 431, 436, 440, 441, 571
Psychology, intelligence test, 902

Life Sciences

Acid rain, 883
Agronomy, 967
Bacterial culture growth, 143, 357, 421, 431
Biomass, 442
Carbon dioxide concentration, 7
Concentration of a chemical in the bloodstream, 189, 234
Diversity of wildflowers in a meadow, 939
DNA molecule, 821
Endangered species, 431
Epidemic model, 441, 558
Forestry, 422, 882
Grand Canyon, 257
Growth of a dog, 294
Hardy-Weinberg Law, 953
Intravenous feeding, 437
Near point of the eye, 955
Oxygen level in a pond, 204
Population growth
  of bacteria, 130, 256, 332
  of brook trout, 440
  of coyotes, 425
  of elk, 428
  of fish, 360
  of fruit flies, 418
  of raccoons, 440
Respiratory cycle, 293
Shannon diversity index, 953
Systolic blood pressure, 954
Topographic map, 150
Trachea contraction, 189
Tree growth, 256

General

Area, 120, 130, 157, 240, 260, 607, 678
Average typing speed, 198, 207
Baseball, 910
Cantor set, 683
Cantor's disappearing table, 608
Distance traveled by a bouncing ball, 604, 606, 681
Error, 237, 241, 907, 909
Football, 843
Maximizing an angle, 377, 381
Maximum area, 43, 223, 225, 226, 244
Maximum volume, 219, 220, 224, 225, 227, 948, 953, 962
Mercator map, 399
Minimum area, 221, 225
Minimum distance, 221, 224, 228, 246
Minimum length, 222, 225, 226, 244, 245
Minimum perimeter, 224
Minimum surface area, 226
Minimum time, 226, 227, 228, 234
Probability, 308, 351, 581, 585, 606, 667, 678, 989, 997
Shot put, 843
Speed, 29, 155, 177, 180, 865, 955
Sphereflake, 607
Sprinkler, 173, 1042
Surface area, 157, 162, 163, 241, 482, 483, 484, 578, 698
Volume, 30, 86, 120, 130, 152, 157, 227, 460, 463, 469, 472, 473, 548, 997
Weight gain, 430
Weight loss, 438
